

Eswatini Multiple Indicator Cluster Survey 2021-2022

Eswatini

Multiple Indicator Cluster Survey 2021-2022

Survey Findings Report

January, 2024

The Eswatini Multiple Indicator Cluster Survey (MICS) was carried out in 2021-2022 by Central Statistical Office (CSO), as part of the Global MICS Programme. Technical support was provided by the United Nations Children's Fund (UNICEF), with government funding and financial support of UNICEF, United Nations Fund for Population Activities (UNFPA) and National Emergency Response Council on HIV/AIDS (NERCHA).

The Global MICS Programme was developed by UNICEF in the 1990s as an international multi-purpose household survey programme to support countries in collecting internationally comparable data on a wide range of indicators on the situation of children and women. MICS surveys measure key indicators that allow countries to generate data for use in policies, programmes, and national development plans, and to monitor progress towards the Sustainable Development Goals (SDGs) and other internationally agreed upon commitments. Eswatini launched national commitments, strategies and frameworks like the National Development Strategy (NDS), Vision 2022 for Swaziland, Swaziland Poverty Reduction Strategy Action Plan (SPRSAP), National Health Sector Strategic Plan NHSSP), National Plan of Action for Children (NPAC) and Eswatini Development Index (EDI).

The objective of this report is to facilitate the timely dissemination and use of results from the Eswatini MICS. The report contains detailed information on the survey methodology, and all standard MICS tables. The report is accompanied by a series of Statistical Snapshots of the main findings of the survey.

Collaborating Institutions & Financial support

The survey was supported technically and financially by the following collaborators:

- National Emergency Response Council on HIV/AIDS (NERCHA)
- Eswatini World Health Organisation (WHO)
- United Nations Population Fund (UNFPA)

For more information on the Global MICS Programme, please go to mics.unicef.org.

SUMMARY TABLE OF SURVEY IMPLEMENTATION AND THE SURVEY POPULATION

Survey sample and implementation			
Sample frame - Updated	2017 Population and Housing Census August 2019 - March 2020	Questionnaires	Household Women (age 15-49) Men (age 15-49) Children under five Children age 5-17 Water Quality Testing
Interviewer training	July-August 2021	Fieldwork	September 2021-March 2022
Survey sample			
Households		Water Quality Testing	
- Sampled	5,265	- Sampled ¹	1,404
- Occupied	4,891	- Occupied	1,299
- Interviewed	4,675	- Response rate (Per cent)	
- Response rate (Per cent)	95.6	- Household	94.2
		- Source	89.9
Women (age 15-49)		Children under five	
- Eligible for interviews	4,575	- Eligible	2,310
- Interviewed	4,294	- Mothers/caretakers interviewed	2,251
- Response rate (Per cent)	93.9	- Response rate (Per cent)	97.4
Men (age 15-49)		Children age 5-17	
- Number in interviewed households	4,401	- Number in interviewed households	5,890
- Eligible for interviews ²	2,003	- Eligible ³	2,251
- Interviewed	1,658	- Mothers/caretakers interviewed	2,490
- Response rate (Per cent)	82.8	- Response rate (Per cent)	97.6

Survey population			
Average household size	3.7	Percentage of population living in	
Percentage of population under:		- Urban areas	24.4
- Age 5	12.1	- Rural areas	75.6
- Age 18	41.8	- Hhohho	29.9
Percentage of women age 15-49 years with at least one live birth in the last 2 years	20.1	- Manzini	31.9
		- Shiselweni	17.9
		- Lubombo	20.3

¹ The Water Quality Testing Questionnaire was administered to four randomly selected households in each cluster.

² The Individual Questionnaire for Men was administered to all men age 15-49 years in every second household

³ The Questionnaire for Children Age 5-17 was administered to one randomly selected child in each interviewed household

ACKNOWLEDGEMENTS

In 2021 - 2022, the Central Statistical Office (CSO) conducted the sixth round of the Multiple Indicator Cluster Survey (MICS), an international household survey developed by UNICEF to monitor progress towards the goals and targets of the Plan of Action for the World Fit For Children (WFFC) Declaration and the Sustainable Development Goals (SDGs). The Eswatini MICS 2021-2022 was implemented in collaboration with various ministries and agencies, including the Deputy Prime Minister's Office, the Ministry of Health, the Ministry of Education and Training, the Ministry of Natural Resources and Energy, the National Emergency Response Council on HIV/AIDS (NERCHA), and United Nations agencies. This report presents results of the Eswatini MICS 2021-2022.

CSO wishes to acknowledge the expert contributions of the MICS Technical and Steering Committees and the UNICEF Country Office for their invaluable guidance in all the phases of this work. We greatly appreciate the contribution and commitment made by CSO staff throughout the survey process. Special recognition is due to all field teams for working tirelessly to bring the survey to a successful conclusion. Lastly, sincere appreciation goes to all interviewed households for their time and cooperation, without which the survey could have not taken place. We are indebted to the UNICEF Global and Regional Offices for the technical backstopping for the survey. We are also grateful for the full financial support from the Government of the Kingdom of Eswatini, as well as technical assistance and financial assistance from other partners like UNICEF, UNFPA, and NERCHA. It is hoped that the findings will contribute to informed policies and programmes that help improve the lives of the Swazi population.

Thembinkosi Shabalala

Director, Central Statistical Office

1 INTRODUCTION

This report is based on the Eswatini Multiple Indicator Cluster Survey (MICS), conducted in 2021-2022 by the Central Statistical Office (CSO). The survey provides statistically sound and internationally comparable data essential for developing evidence-based policies and programmes, and for monitoring progress toward national goals and global commitments.

A Commitment to Action: National and International Reporting Responsibilities

More than two decades ago, the **Plan of Action for Implementing the World Declaration on the Survival, Protection and Development of Children in the 1990s** called for:

“Each country should establish appropriate mechanisms for the regular and timely collection, analysis and publication of data required to monitor relevant social indicators relating to the well-being of children Indicators of human development should be periodically reviewed by national leaders and decision makers, as is currently done with indicators of economic development...”

The Multiple Indicator Cluster Surveys programme was developed soon after, in the mid-1990s, to support countries in this endeavour.

Governments that signed the **World Fit for Children Declaration and Plan of Action** also committed themselves to monitoring progress towards the goals and objectives:

“We will monitor regularly at the national level and, where appropriate, at the regional level and assess progress towards the goals and targets of the present Plan of Action at the national, regional and global levels. Accordingly, we will strengthen our national statistical capacity to collect, analyse and disaggregate data, including by sex, age and other relevant factors that may lead to disparities, and support a wide range of child-focused research” (A World Fit for Children, paragraph 60)

Similarly, the **Millennium Declaration** (paragraph 31) called for periodic reporting on progress:

“...We request the General Assembly to review on a regular basis the progress made in implementing the provisions of this Declaration, and ask the Secretary-General to issue periodic reports for consideration by the General Assembly and as a basis for further action.”

The General Assembly Resolution, adopted on 25 September 2015, “**Transforming Our World: the 2030 Agenda for Sustainable Development**” stipulates that for the success of the universal SDG agenda,

“quality, accessible, timely and reliable disaggregated data will be needed to help with the measurement of progress and to ensure that no one is left behind” (paragraph 48); recognizes that “...baseline data for several of the targets remains unavailable...” and calls for “...strengthening data collection and capacity building in Member States...”

The Government of Eswatini is committed to implementing the Sustainable development goals and has prioritized and ranked the SDGs giving due attention and consideration to domestic contextual realities and future development potentials. The priority is on the following goals: Goal 1: No poverty; Goal 2: Zero hunger; Goal 3: Good health and well-being; Goal 4: Quality education; Goal 6: Clean water and sanitation; Goal 7: Affordable and clean energy; Goal 8: Decent work and economic growth; Goal 9: Industry, innovation and infrastructure and Goal 13: Climate action.

The National Development Strategy (NDS) has been the main framework for the achievement of sustainable development in Eswatini. Since the adoption of the SDGs, government has put in place policies that takes into consideration three dimensions for sustainable development namely; economic, social and environment. For instance, policies relating to decent work such as the Eswatini National Social Security Policy (2020) show how SDG 8 is an enabler for achieving goals SDG 16, SDG 3, SDG 1, SDG 10 and SDG 5.

The SDG assessment conducted in 2022 highlighted a number of challenges which include lack of timely and quality data for adequate monitoring of SDG targets, limited capacity for effective implementation of the goals at different levels and inadequate involvement of the private sector in the development agenda. (Eswatini VNR, 2022⁴).

The assessment also focused on child well-being from the child's rights-based approach to ensure no child in Eswatini is left behind. The assessment was centred around five (5) overarching areas of well-being for every child namely; (a) Survive and Thrive, (b) Learning (c) Social Protection (d) Environment and (e) Fair Chance. These five (5) areas are grounded in the 2030 Agenda for Sustainable Development. However, the analysis was challenged by unavailability of updated data. In this regard, the Eswatini MICS 2021-2022 results are critically important for the purposes of SDG monitoring, as the survey produces information on 44 global SDG indicators and 32 SDG indicators adopted by the Government of Eswatini, either in their entirety or partially.

The Eswatini MICS 2021-2022 has as its primary objectives:

- To provide high quality data for assessing the situation of children, adolescents, women and households in Eswatini;
- To furnish data needed for monitoring progress toward national goals, as a basis for future action;
- To collect disaggregated data for the identification of disparities, to inform policies aimed at social inclusion of the most vulnerable;
- To validate data from other sources and the results of focused interventions;
- To generate data on national and global SDG indicators;
- To generate internationally comparable data for the assessment of the progress made in various areas, and to put additional efforts in those areas that require more attention;
- To generate behavioural and attitudinal data not available in other data sources.

⁴ <https://eswatini.un.org/en/219477-second-voluntary-national-review-report-2022>

This report presents the results of the 2021-2022 Eswatini MICS. Following Chapter 2 on survey organisation and methodology, including sample design and implementation, all indicators covered by the survey, with their definitions, are presented in “Indicators and definitions”. Prior to presenting the survey results, organized into thematic chapters, the coverage of the sample and the main characteristics of respondents is covered in Chapter 4, “Sample coverage and characteristics of respondents”. From Chapter 5, all survey results are presented in seven thematic chapters. In each chapter, a brief introduction of the topic and the description of all tables, are followed by the tabulations.

Chapter 5, “Survive”, includes findings on under-5 mortality.

This is followed by Chapter 6, “Thrive – Reproductive and maternal health”, which presents findings on fertility, early childbearing, contraception, unmet need, antenatal care, neonatal tetanus, delivery care, birthweight, and post-natal care and HIV, and ends with male circumcision and other health conditions.

The following chapter, “Thrive – Child health, nutrition and development” presents findings on immunisation, disease episodes, diarrhoea, household energy use, symptoms of acute respiratory infection, malaria, infant and young child feeding, malnutrition, salt iodisation, and early childhood development.

Learning is the topic of the next chapter, where survey findings on early childhood education, educational attendance, paternal involvement in children’s education, and foundational learning skills are covered.

The next chapter, “Protected from violence and exploitation”, includes survey results on birth registration, child discipline, child labour, child marriage, victimisation, feelings of safety, and attitudes toward domestic violence, decision making and violence against girls and women.

Chapter 10, “Live In a safe and clean environment”, covers the topics of drinking water, handwashing, sanitation, and menstrual hygiene.

The final thematic chapter is on equity – titled “Equitable chance in life”, the chapter presents findings on a range of equity related topics, including child functioning, social transfers, discrimination and harassment, and subjective well-being.

The report ends with appendices, with detailed information on sample design, personnel involved in the survey, estimates of sampling errors, data quality, and the questionnaires used.

2 SURVEY ORGANISATION AND METHODOLOGY

2.1 SURVEY ORGANISATION

The Eswatini MICS 2021-2022 was implemented by a Survey Management Team formed and led by the Social Statistics Unit of the Central Statistical Office (CSO). Oversight was provided by a Steering Committee and technical decisions and processes were guided and supported by a Technical Committee.⁵ The Global MICS Team of UNICEF provided on and off-site support and reviews during key phases of the survey as per the standard Technical Collaboration Framework of the global MICS programme and the Memorandum of Understanding between the CSO and UNICEF.

2.2 SAMPLE DESIGN

The sample for the Eswatini MICS 2021-2022 was designed to provide estimates for a large number of indicators on the situation of children and women at the national level, for urban and rural areas, and for four regions: Hhohho, Manzini, Shiselweni and Lubombo. The urban and rural areas within each region were identified as the main sampling strata and the sample of households was selected in two stages. Within each stratum, a specified number of census enumeration areas were selected systematically with probability proportional to size. After a household listing was carried out within the selected enumeration areas, a systematic sample of 15 households was drawn in each sample enumeration area. A total of 351 sample enumeration areas and 5,265 households were selected. All of the selected enumeration areas were visited because they were accessible due to proximity during the fieldwork period. As the sample is not self-weighting sample weights are used for reporting survey results. A more detailed description of the sample design can be found in Appendix A: Sample Design.

2.3 QUESTIONNAIRES

Six questionnaires were used in the survey: 1) a household questionnaire to collect basic demographic information on all *de jure* household members (usual residents), the household, and the dwelling; 2) a water quality testing questionnaire administered in four households in each cluster of the sample; 3) a questionnaire for individual women administered in each household to all women age 15-49 years; 4) a questionnaire for individual men administered in every second household to all men age 15-49 years; 5) an under-5 questionnaire, administered to mothers (or caretakers) of all children under 5 living in the household; and 6) a questionnaire for children age 5-17 years, administered to the mother (or caretaker) of one randomly selected child age 5-17 years living in the household.⁶ The questionnaires included the following modules:

⁵ Membership of the Survey Management Team, Steering and Technical Committees are listed in Appendix B.

⁶ Children age 15-17 years living without their mother and with no identified caretaker in the household were considered emancipated and the questionnaire for children age 5-17 years was administered directly to them. This slightly reworded questionnaire that only includes the Child's Background, Child Labour and Child Functioning modules is not reproduced in Appendix E.

Household Questionnaire	Questionnaire for Individual Women / Men	Questionnaire for Children Age 5-17 Years
List of Household Members Education Household Characteristics Social Transfers Covid - 19 Household Energy Use Water and Sanitation Handwashing Snakebite Salt Iodisation	Woman's Background ^[M] Mass Media and ICT ^[M] Fertility ^[M] /Birth History Desire for Last Birth Maternal and Newborn Health Post-natal Health Checks Contraception ^[M] Unmet Need Attitudes Toward Domestic Violence ^[M] Victimisation ^[M] Marriage/Union ^[M] Adult Functioning ^[M] Sexual Behaviour ^[M] HIV/AIDS ^[M] Circumcision ^[only M] Tobacco and Alcohol Use ^[M] Non – Communicable Diseases ^[M] Covid - 19 ^[M] Mental Health/Suicide ^[M] Life Satisfaction ^[M] Domestic Violence	Child's Background Child Labour Child Discipline Child Functioning Parental Involvement Foundational Learning Skills
Water Quality Testing Questionnaire		Questionnaire for Children Under 5
		Under-Five's Background Birth Registration Early Childhood Development Child Discipline Child Functioning Breastfeeding and Dietary Intake Immunisation Care of Illness Anthropometry

^[M] The individual Questionnaire for Men only included those modules indicated.

In addition to the administration of questionnaires, fieldwork teams tested the salt used for cooking in the households for iodine content, observed the place for handwashing, measured the weights and heights of children age under 5 years⁷, and tested household and source water for *E. coli* levels. Details and findings of these observations and measurements are provided in the respective sections of the report. Further, the questionnaire for children age 5-17 years included a reading and mathematics assessment administered to children age 7-14 years.

The questionnaires were based on the MICS6 standard questionnaires.⁸ Non-standard modules were included: snakebite, non-communicable diseases, women taking own decisions, violence against girls and women. From the MICS6 model English version, the questionnaires were customised and translated into Siswati language and were pre-tested in Siphocosini and Nkwalini Zone 2 of the pre-test during November-December 2020. Based on the results of the pre-test, modifications were made to the wording and translation of the questionnaires. A copy of the Eswatini MICS 2021-2022 questionnaires is provided in Appendix E in English and Siswati language.

2.4 ETHICAL PROTOCOL

The survey protocol was approved by Ethics Committee in August, 2021. The protocol included a Protection Protocol which outlines the potential risks during the life cycle of the survey and management strategies to mitigate these.

Verbal consent was obtained for each respondent participating and, for children age 15-17 years individually interviewed, adult consent was obtained in advance of the child's assent. All respondents were informed of the voluntary nature of participation and the confidentiality and anonymity of information. Additionally, respondents were informed of their right to refuse answering all or particular questions, as well as to stop the interview at any time.

⁷ Weight was measured using the Seca 874 U Electronic Scale. The survey piloted the use of a digital device for length or height measurements. See Section 7.7 Malnutrition for further information.

⁸ <http://mics.unicef.org/tools#survey-design>.

2.5 DATA COLLECTION METHOD

MICS surveys utilise Computer-Assisted Personal Interviewing (CAPI). The data collection application was based on the CPro (Census and Survey Processing System) software, Version 6.3, including a MICS dedicated data management platform. Procedures and standard programs⁹ developed under the global MICS programme were adapted to the Eswatini MICS 2021-2022 final questionnaires and used throughout. The CAPI application was tested in Ezulwini in February 2021. Based on the results of the CAPI-test, modifications were made to the questionnaires and application.

2.6 TRAINING

Training for the fieldwork was conducted for 29 days in July - August 2021. Training included lectures on interviewing techniques and the contents of the questionnaires, and mock interviews between trainees to gain practice in asking questions. Participants first completed full training on paper questionnaires, followed by training on the CAPI application. The trainees spent four days in field practice and one day on a full pilot survey in Ezulwini and Mvutshini. The training agenda was based on the template MICS6 training agenda.¹⁰

Measurers received dedicated training on anthropometric measurements and water quality testing for a total of seven days, including four days in field practice and pilot survey¹¹.

Field Supervisors attended additional training on the duties of team supervision and responsibilities.

2.7 FIELDWORK

The data were collected by eight teams; each was comprised of four interviewers, one driver, one measurer and a supervisor. Fieldwork began in September 2021 and concluded in March 2022. There were several challenges that delayed and interrupted data collection at various times. Although fieldwork teams were prioritized and got vaccinated during the training period, COVID-19 was spread out very fast among the team because teams stay in collective residencies. COVID affected more than 50% of fieldwork staff including drivers. There were 2 waves in August 2021 and January 2022 respectively. Infected people and close contacts had to be isolated for 10 days. It delayed the process for 3-4 weeks. Civil unrests disturbed the beginning of data collection. It had also some impact on fuel availability, so some teams were obliged to suspend the data collection for about 1-2 weeks. In 2022, the rainy season started early and caused damage on roads and bridges. This had also an impact on data collection schedule.

Data was collected using tablet computers running the Windows 10 operating system, utilising a Bluetooth application for field operations, enabling transfer of assignments and completed questionnaires between supervisor and interviewer tablets.

⁹ <http://mics.unicef.org/tools#data-processing>

¹⁰ <http://mics.unicef.org/tools#survey-design>

¹¹ The training of Measurers was preceded by a separate training and test protocol to determine whether the digital measurement board could be recommended for use in the survey. The quantitative test results and qualitative assessment by the Central Statistics Office were positive and the main fieldwork training included training on both the digital measurement board and the standard analogue board. See Section 7.7 Malnutrition for further information.

2.8 FIELDWORK QUALITY CONTROL MEASURES

Team supervisors were responsible for the daily monitoring of fieldwork. Mandatory re-interviewing was implemented on three households per cluster. Daily observations of interviewer skills and performance was conducted.

During the fieldwork period, each team was visited multiple times by survey management team members and field visits were arranged for UNICEF MICS Team members.

Throughout the fieldwork, field check tables (FCTs) were produced weekly for analysis and action with field teams. The FCTs were customised versions of the standard tables produced by the MICS Programme.¹²

2.9 DATA MANAGEMENT AND EDITING

Data were received at the Central Statistical Office via Internet File Streaming System (IFSS) integrated into the management application on the supervisors' tablets. Whenever logistically possible, synchronisation was daily. The central office communicated application updates to field teams through this system.

During data collection and following the completion of fieldwork, data were edited according to editing process described in detail in the Data Editing Guidelines, a customised version of the standard MICS6 documentation.¹³

2.10 ANALYSIS AND REPORTING

Sample weights and background characteristics were computed and added to the final data. Analysis was done using the Statistical Package for Social Sciences (SPSS) software, Version 24. Model syntax and tabulation plan developed by UNICEF were customised and used for this purpose.¹⁴

The Survey Findings Report and accompanying Statistical Snapshots were drafted based on the templates developed by the global MICS Programme¹⁵. These were presented and reviewed by subject matter experts during the Data Interpretation and Report Compilation (DIRC) Workshop held in Happy Valley Hotel on 28th July 2003. The finalisation of the Survey Findings Report and Statistical Snapshots was managed by the Survey Management Team with guidance from the Technical Committee and the participants in the DIRC Workshop.

¹⁴ <http://mics.unicef.org/tools#analysis>

¹⁵ <http://mics.unicef.org/tools#reporting>

2.11 DATA SHARING

Unique identifiers such as location and personal details collected during interviews were removed from datasets to ensure privacy. These anonymised data files are made available on <https://ndcc.eswatinistats.org.sz> and on the MICS website¹⁶ and can be freely downloaded for legitimate research purposes. Users are required to submit final research to entities listed in the included readme file, strictly for information purposes.

Geocode, i.e., latitude, longitude and altitude, was collected/is available for each survey cluster. To ensure respondent protection, these data are not publicly available. Anonymised geocodes can be requested by contacting the Central Statistical Office, as indicated in the readme file included with the data. Specific terms of use will apply.

3 INDICATORS AND DEFINITIONS

MICS INDICATOR	SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value	
SAMPLE COVERAGE AND CHARACTERISTICS OF THE RESPONDENTS					
SR.1		7.1.1	HC	Percentage of household members with access to electricity	82.7
SR.2			WB	Percentage of women and men age 15-24 years who are able to read a short simple statement about everyday life or who attended secondary or higher education Women Men	93.1 89.0
SR.3			MT	Percentage of women and men age 15-49 years who, at least once a week, read a newspaper or magazine, listen to the radio, and watch television Women Men	12.0 15.3
SR.S1			HC	Percentage of households where a member listens to the Eswatini Broadcasting and Information Services (EBIS) radio station	65.5
SR.S2			HC	Percentage of households that reported receiving good signal for the Eswatini Broadcasting and Information Services (EBIS) radio station	77.2
SR.S3			HC	Percentage of households where a member watches the Eswatini Television station	20.9
SR.S4			HC	Percentage of households that reported receiving good signal for the Eswatini Television station	30.6
SR.4			HC	Percentage of households that have a radio	59.2

¹⁷ Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. MICS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by MICS. The latter cases are included here as long as the current international methodology allows for only the way that the MICS indicator is defined, and/or a significant part of the SDG indicator can be generated by the MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>

¹⁸ Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

¹⁹ All MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, ethnicity, migratory status, disability and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

MICS INDICATOR		SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value
SR.5	Households with a television		HC	Percentage of households that have a television	63.8
SR.6	Households with a telephone		HC – MT	Percentage of households that have a telephone (fixed line or mobile phone)	98.6
SR.7	Households with a computer		HC	Percentage of households that have a computer	17.3
SR.8	Households with internet		HC	Percentage of households that have access to the internet by any device from home	62.7
SR.9	Use of computer		MT	Percentage of women and men age 15-49 years who used a computer during the last 3 months	16.7
				Women	18.1
SR.10	Ownership of mobile phone	5.b.1	MT	Percentage of women and men age 15-49 years who own a mobile phone	90.0
				Women	91.1
SR.11	Use of mobile phone		MT	Percentage of women and men age 15-49 years who used a mobile telephone during the last 3 months	93.6
				Women	92.6
SR.12a SR.12b	Use of internet	17.8.1	MT	Percentage of women and men age 15-49 years who used the internet	
				Women	54.6
				(a) during the last 3 months	50.4
				(b) at least once a week during the last 3 months	
				Men	50.1
				(a) during the last 3 months	47.5
				(b) at least once a week during the last 3 months	
SR.S5 SR.S6	Use of social media		MT	Percentage of women and men who	
				Women	52.5
				(a) used any social media platform everyday during the last 3 months	65.6
				(b) used any of the four common social media platforms at least once in the last 3 months ²⁰	
				Men	53.8
				(c) used any social media platform everyday during the last 3 months	64.7
				(d) used any of the four common social media platforms at least once in the last 3 months ⁴	

²⁰ According to the survey the 4 common social media platforms were defined as WhatsApp, Facebook, Twitter and Instagram.

MICS INDICATOR		SDG ¹⁷	Module ¹⁸	Definition ¹⁹	Value
SR.13a SR.13b	ICT skills	4.4.1	MT	Percentage of women and men who have carried out at least one of nine specific computer related activities during the last 3 months Women (a) age 15-24 (b) age 15-49 Men (c) age 15-24 (d) age 15-49	17.2 14.6 18.0 16.6
SR.18	Children's living arrangements		HL	Percentage of children age 0-17 years living with neither biological parent	27.7
SR.19	Prevalence of children with one or both parents dead		HL	Percentage of children age 0-17 years with one or both biological parents dead	11.4
SR.20	Children with at least one parent living abroad		HL	Percentage of children age 0-17 years with at least one biological parent living abroad	11.7
SR.S7 SR.S8	Use of tobacco products		TA	Percentage of women and men who Women (a) currently use tobacco products (b) use tobacco products daily Men (c) currently use tobacco products (d) use tobacco products daily	2.6 1.0 17.4 13.7
SR.S9 SR.S10 SR.S11	Alcohol consumption		TA	Percentage of women and men who Women (a) ever consumed any alcohol (b) consumed any alcohol in the past 12 months (c) consumed any alcohol in the past 30 days Men (d) ever consumed any alcohol (e) consumed any alcohol in the past 12 months (f) consumed any alcohol in the past 30 days	26.6 16.5 10.4 47.3 39.9 32.0

TM.5a TM.5b TM.5c	Antenatal care coverage	3.8.1	MN	Percentage of women age 15-49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth were attended (a) at least once by skilled health personnel (b) at least four times by any provider (c) at least eight times by any provider	98.6 73.5 5.0
TM.6	Content of antenatal care		MN	Percentage of women age 15-49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth, at least once, had blood pressure measured and gave urine and blood samples as part of antenatal care	93.3
TM.S3	Content of antenatal care all 8		MN	Percentage of women age 15-49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth, at least once, had blood pressure, weight and height measured and gave urine and blood sample and took iron and folic acid supplements as part of antenatal care	32.2
TM.7	Neonatal tetanus protection		MN	Percentage of women age 15-49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth were given at least two doses of tetanus toxoid containing vaccine or had received the appropriate number of doses with appropriate interval ²³ prior to the most recent birth	74.9
TM.8	Institutional deliveries		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live birth was delivered in a health facility	92.7

²² See Table TM.3.3 for a detailed description

²³ See Table TM.5.1 for a detailed description

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TM.9	Skilled attendant at delivery	3.1.2	MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live birth was attended by skilled health personnel	93.4
TM.10	Caesarean section		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live birth was delivered by caesarean section	16.5
TM.11	Children weighed at birth		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was weighed at birth	97.4
TM.12	Post-partum stay in health facility		PN	Percentage of women age 15-49 years with a live birth in the last 2 years and delivered the most recent live birth in a health facility who stayed in the health facility for 12 hours or more after the delivery	81.5
TM.13	Post-natal health check for the newborn		PN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child received a health check while in facility or at home following delivery, or a post-natal care visit within 2 days after delivery	90.3
TM.14	Newborns dried		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was dried after birth	74.7
TM.15	Skin-to-skin care		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was placed on the mother's bare chest after birth	43.5
TM.16	Delayed bathing		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was first bathed more than 24 hours after birth	59.5
TM.17	Cord cut with clean instrument		MN	Percentage of women age 15-49 years with a live birth in the last 2 years and delivered the most recent live-born child outside a facility whose umbilical cord was cut with a new blade or boiled instrument	44.7
TM.18	Nothing harmful applied to cord		MN	Percentage of women age 15-49 years with a live birth in the last 2 years and delivered the most recent live-born child outside a facility who had nothing harmful applied to the cord	88.3
TM.19	Post-natal signal care functions ²⁴		PN	Percentage of women age 15-49 years with a live birth in the last 2 years for whom the most recent live-born child received a least 2 post-natal signal care functions within 2 days of birth	71.9
TM.20	Post-natal health check for the mother		PN	Percentage of women age 15-49 years with a live birth in the last 2 years who received a health check while in facility or at home following delivery, or a post-natal care visit within 2 days after delivery of their most recent live birth	79.8
TM.S4	Provision of care-seeking information for mother		PN	Percentage of women age 15-49 years with a live birth in the last 2 years who received information on the post-delivery symptoms requiring care-seeking for herself after delivery of their most recent live birth	49.3
TM.22	Multiple sexual partnerships		SB	Percentage of women and men age 15-49 years who had sex with more than one partner in the last 12 months Women Men	3.8 18.0

²⁴ Signal functions are 1) Checking the cord, 2) Counseling on danger signs, 3) Assessing temperature, 4) Observing/counseling on breastfeeding, and 5) Weighing the baby (where applicable).

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TM.23	Condom use at last sex among people with multiple sexual partnerships		SB	Percentage of women and men age 15-49 years reporting having had more than one sexual partner in the last 12 months who reported that a condom was used the last time they had sex Women Men	62.2 69.7
TM.24	Sex before age 15 among young people		SB	Percentage of women and men age 15-24 years who had sex before age 15 Women Men	3.3 3.2
TM.25	Young people who have never had sex		SB	Percentage of never married women and men age 15-24 years who have never had sex Women Men	47.9 52.0
TM.26	Age-mixing among sexual partners		SB	Percentage of women age 15-24 years reporting having had sex in the last 12 months who had a partner 10 or more years older	17.2
TM.27	Sex with non-regular partners		SB	Percentage of women and men age 15-24 years reporting having had sex in the last 12 months who had a non-marital, non-cohabitating partner Women Men	85.6 98.2
TM.28	Condom use with non-regular partners		SB	Percentage of women and men age 15-24 years reporting having had sex in the last 12 months with a non-marital, non-cohabitating partner who reported that a condom was used the last time they had sex Women Men	72.0 87.3
TM.29	Comprehensive knowledge about HIV prevention among young people		HA	Percentage of women and men age 15-24 years who correctly identify the two ways of preventing the sexual transmission of HIV ²⁵ , who know that a healthy-looking person can be HIV-positive and who reject the two most common misconceptions about HIV transmission Women Men	50.9 46.5
TM.30	Knowledge of mother-to-child transmission of HIV		HA	Percentage of women and men age 15-49 years who correctly identify all three means ²⁶ of mother-to-child transmission of HIV Women Men	67.6 51.4

²⁵ Using condoms and limiting sex to one faithful, uninfected partner

²⁶ Transmission during pregnancy, during delivery, and by breastfeeding

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TM.31	Discriminatory attitudes towards people living with HIV		HA	Percentage of women and men age 15-49 years reporting having heard of HIV who report discriminatory attitudes ²⁷ toward people living with HIV Women Men	9.6 8.0
TM.32	People who know where to be tested for HIV		HA	Percentage of women and men age 15-49 years who state knowledge of a place to be tested for HIV Women Men	98.0 96.3
TM.33	People who have been tested for HIV and know the results		HA	Percentage of women and men age 15-49 years who report having been tested for HIV in the last 12 months and know their results Women Men	66.1 52.5
TM.34	Sexually active young people who have been tested for HIV and know the results		HA	Percentage of women and men age 15-24 years reporting having had sex in the last 12 months, who have been tested for HIV in the last 12 months and know their results Women Men	80.8 56.4
TM.35a TM.35b	HIV counselling during antenatal care		HA	Percentage of women age 15-49 years with a live birth in the last 2 years who received antenatal care at least once by skilled health personnel during the pregnancy of the most recent live birth and during an ANC visit received (a) counselling on HIV ²⁸ (b) information or counselling on HIV after receiving the HIV test results	83.9 81.4
TM.36	HIV testing during antenatal care		HA	Percentage of women age 15-49 years with a live birth in the last 2 years who received antenatal care at least once by skilled health personnel during the pregnancy of the most recent live birth and during an ANC visit were offered and accepted an HIV test and received test results	91.8
TM.37	Male circumcision		MMC	Percentage of men age 15-49 years who report having been circumcised	44.1
TM.S5	Informed about Covid-19		CV	Percentage of women and men age 15-49 years who report being well or somewhat informed about Covid-19 Women Men	95.9 94.8

²⁷ Respondents who answered no to either of the following two questions: 1) Would you buy fresh vegetables from a shopkeeper or vendor if you knew that this person had HIV? 2) Do you think children living with HIV should be able to attend school with children who are HIV negative?

²⁸ Someone talked with the respondent about all three of the following topics: 1) Babies getting the HIV from their mother, 2) preventing HIV and 3) getting tested for HIV

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TM.S6	Knowledge of prevention of Covid-19		CV	Percentage of women and men age 15-49 years who know the three most common ways of preventing the spread of Covid-19 ²⁹ Women Men	53.2 69.6
TM.S7	Covid-19 misconceptions		CV	Percentage of women and men age 15-49 years who correctly identify the three popular misconceptions regarding the prevention or treatment of Covid-19 ³⁰ Women Men	5.7 13.5
TM.S8	Discriminatory attitudes for Covid-19		CV	Percentage of women and men age 15-49 years reporting that they would be afraid of associating with a survivor of Covid-19 Women Men	12.3 7.4
TM.S9	Access to medical services during Covid-19 restrictions		CV	Percentage of women and men age 15-49 years who report that they could not receive medical treatment when needed at the height of the Covid-19 pandemic due to Covid-19 related reasons Women Men	58.3 37.5
TM.S10 TM.S11	Ever examined for Non-Communicable Disease		ND	Percentage of women and men age 15-49 years who have ever been medically examined for Non-Communicable Disease ³¹ (NCD) Women (a) Hypertension (b) Diabetes Men (c) Hypertension (d) Diabetes	81.5 26.7 54.7 25.2

²⁹ The 3 common ways of Covid-19 prevention have been defined as regular washing or sanitizing of hands, covering of mouth when sneezing and maintaining a safe distance with people in public places.

³⁰ The 3 three popular misconceptions on covid prevention have been defined as use of home-made remedies, living in hot climate conditions, prevented/treated through body steaming

³¹ Respondents were either asked about diabetes, hypertension, cervical and breast cancer if female or diabetes, hypertension and prostate cancer if male

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TM.S12 TM.S13	Diagnosed with Non-Communicable Disease in past 12 months		ND	Percentage of women and men age 15-49 years who have been medically diagnosed with Non-Communicable Disease ³² in the past 12 months (NCD) Women (a) Hypertension (b) Diabetes Men (c) Hypertension (d) Diabetes	4.5 0.2 3.2 0.1
TM.S14 TM.S15	Currently on medical treatment for Non-Communicable Disease		ND	Percentage of women and men age 15-49 years who took medical treatment for Non-Communicable Disease ³³ (NCD) in the last 2 weeks Women (a) Hypertension (b) Diabetes Men (c) Hypertension (d) Diabetes	3.3 0.6 1.1 1.1
TM.S16	Currently taking insulin treatment		ND	Percentage of women and men age 15-49 years who took insulin treatment during the time of survey Women Men	0.2 0.1
TM.S17	Took medical treatment for asthma in the past 12 months		ND	Percentage of women and men age 15-49 years who took medical treatment for asthma in the past 12 months Women Men	3.9 0.8
TM.S18	Ever screened for cervical cancer		ND	Percentage of women age 15-49 years who have ever been screened for cervical cancer	39.8
TM.S19	Ever screened for breast cancer		ND	Percentage of women age 15-49 years who have ever been screened for breast cancer	25.0
TM.S20	Ever attempted suicide		ND	Percentage of women and men age 15-49 years who have ever attempted suicide Women Men	7.4 2.8

³² Respondents were either asked about diabetes, hypertension and asthma

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TM.S21	Attempted suicide in the last 12 months		ND	Percentage of women and men age 15-49 years who have attempted suicide in the past 12 months Women Men	14.2 8.3
TM.S22	Close family member died from suicide		ND	Percentage of women and men age 15-49 years who reported that a close family member has died from suicide Women Men	6.9 3.8

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
THRIVE - CHILD HEALTH, NUTRITION AND DEVELOPMENT					
TC.1	Tuberculosis immunization coverage		IM	Percentage of children age 12-23 months who received BCG containing vaccine at any time before the survey	94.8
TC.2	Polio immunization coverage		IM	Percentage of children age 12-23 months who received at least one dose of Inactivated Polio Vaccine (IPV) and the third/fourth dose of either IPV or Oral Polio Vaccine (OPV) vaccines at any time before the survey	84.3
TC.3	Diphtheria, tetanus and pertussis (DTP) immunization coverage	3.b.1 & 3.8.1	IM	Percentage of children age 12-23 months who received the third dose of DTP containing vaccine (DTP3) at any time before the survey	87.9
TC.4	Hepatitis B immunization coverage		IM	Percentage of children age 12-23 months who received the third/fourth dose of Hepatitis B containing vaccine (HepB3) at any time before the survey	87.9
TC.5	Haemophilus influenzae type B (Hib) immunization coverage		IM	Percentage of children age 12-23 months who received the third dose of Hib containing vaccine (Hib3) at any time before the survey	87.9
TC.6	Pneumococcal (Conjugate) immunization coverage	3.b.1	IM	Percentage of children age 12-23 months who received the third dose of Pneumococcal (Conjugate) vaccine (PCV3) at any time before the survey	87.8
TC.7	Rotavirus immunization coverage		IM	Percentage of children age 12-23 months who received the second/third dose of Rotavirus vaccine (Rota2) at any time before the survey	80.1
TC.8	Rubella immunization coverage		IM	Percentage of children age 12-23 months who received rubella containing vaccine at any time before the survey	89.6
TC.10	Measles immunization coverage	3.b.1	IM	Percentage of children age 24-35 months who received the second measles containing vaccine at any time before the survey	79.9
TC.S1	Vitamin A supplementation coverage		IM	Percentage of children age 24-35 months who received the second dose of Vitamin A supplement at any time before the survey	75.8

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TC.S2	Deworming coverage		IM	Percentage of children age 24-35 months who received the second dose of Albendazole at any time before the survey	66.8
TC.11a TC.11b	Full immunization coverage ³⁴		IM	Percentage of children who at age a) 12-23 months had received all basic vaccinations at any time before the survey b) 24-35 months had received all vaccinations recommended in the national immunization schedule	77.0 66.1
TC.12	Care-seeking for diarrhoea		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	42.5
TC.13a TC.13b	Diarrhoea treatment with oral rehydration salt solution (ORS) and zinc		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received a) ORS b) ORS and zinc	67.9 27.1
TC.14	Diarrhoea treatment with oral rehydration therapy (ORT) and continued feeding		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received ORT (ORS packet, pre-packaged ORS fluid, recommended homemade fluid or increased fluids) and continued feeding during the episode of diarrhoea	37.1
TC.15	Primary reliance on clean fuels and technologies for cooking		EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking (living in households that reported cooking)	43.0
TC.16	Primary reliance on clean fuels and technologies for space heating		EU	Percentage of household members with primary reliance on clean fuels and technologies for space heating (living in households that reported the use of space heating)	16.6
TC.17	Primary reliance on clean fuels and technologies for lighting		EU	Percentage of household members with primary reliance on clean fuels and technologies for lighting (living in households that reported the use of lighting)	81.6
TC.18	Primary reliance on clean fuels and technologies for cooking, space heating and lighting	7.1.2	EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking, space heating and lighting ³⁵	34.5
TC.19	Care-seeking for children with acute respiratory infection (ARI) symptoms	3.8.1	CA	Percentage of children under age 5 with ARI symptoms in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	(43.6) ³⁶

³⁴ Basic vaccinations include BCG, 3 doses of polio, 3 doses of DTP and 1 dose of measles vaccination. All vaccinations include all doses of vaccinations recommended for children under age 2 years in the national schedule.

³⁵ Household members living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator

³⁶ Due to very low prevalence of ARI, this figure is based on 25-49 unweighted cases. Therefore, no disaggregate is presented in this report. In addition to that, the percentage of children under age 5 with ARI symptoms in the last 2 weeks who received antibiotics (indicator TC.20) is not presented

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TC.26	Care-seeking for fever		CA	Percentage of children under age 5 with fever in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	40.7
TC.27	Malaria diagnostics usage		CA	Percentage of children under age 5 with fever in the last 2 weeks who had a finger or heel stick for malaria testing	13.0
TC.28	Anti-malarial treatment of children under age 5		CA	Percentage of children under age 5 with fever in the last 2 weeks who received any antimalarial treatment	2.8
TC.30	Children ever breastfed		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were ever breastfed	94.0
TC.31	Early initiation of breastfeeding		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	46.7
TC.S3	Exclusively breastfed for the first three days after birth		MN	Percentage of most recent live-born children to women age 15-49 years with a live birth in the last 2 years who were exclusively breastfed for the first three days after birth	88.8
TC.32	Exclusive breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who are exclusively breastfed ³⁷	54.3
TC.33	Predominant breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who received breast milk as the predominant source of nourishment ³⁸ during the previous day	57.8
TC.S4	Mixed milk feeding under 6 months		BD	Percentage of infants under 6 months of age who received mixed milk feeding	10.0
TC.S5	Continued breastfeeding 12-23 months		BD	Percentage of children age 12-23 months who received breast milk during the previous day	33.7
TC.34	Continued breastfeeding at 1 year		BD	Percentage of children age 12-15 months who received breast milk during the previous day	56.4
TC.35	Continued breastfeeding at 2 years		BD	Percentage of children age 20-23 months who received breast milk during the previous day	13.8
TC.36	Duration of breastfeeding		BD	The age in months when 50 percent of children age 0-35 months did not receive breast milk during the previous day	14.7
TC.37	Age-appropriate breastfeeding		BD	Percentage of children age 0-23 months appropriately fed ³⁹ during the previous day	49.1

³⁷ Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines

³⁸ Infants who receive breast milk and certain fluids (water and water-based drinks, fruit juice, ritual fluids, oral rehydration solution, drops, vitamins, minerals, and medicines), but do not receive anything else (in particular, non-human milk and food-based fluids)

³⁹ Infants age 0-5 months who are exclusively breastfed, and children age 6-23 months who are breastfed and ate solid, semi-solid or soft foods

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TC.38	Introduction of solid, semi-solid or soft foods		BD	Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	95.2
TC.39a TC.S6b	Minimum acceptable diet		BD	Percentage of children age 6–23 months who had at least the minimum dietary diversity and the minimum meal frequency during the previous day (a) breastfed children (b) non-breastfed children	24.5 1.3
TC.40	Milk feeding frequency for non-breastfed children		BD	Percentage of non-breastfed children age 6-23 months who received at least 2 milk feedings during the previous day	75.8
TC.41	Minimum dietary diversity		BD	Percentage of children age 6–23 months who received foods from 5 or more food groups ⁴⁰ during the previous day	30.0
TC.S7	Minimum meal frequency		BD	Percentage of children age 6-23 months who received solid, semi-solid and soft foods (plus milk feeds for non-breastfed children) the minimum number of times ⁴¹ or more during the previous day	68.5
TC.S8	Minimum acceptable diet (6-23 months)		BD	Percentage of children age 6–23 months who had at least the minimum dietary diversity and the minimum meal frequency during the previous day	14.4
TC.43	Bottle feeding		BD	Percentage of children age 0-23 months who were fed with a bottle during the previous day	39.4
TC.S9	Egg and/or flesh food consumption		BD	Percentage of children age 6-23 months who consumed egg and/or flesh food during the previous day	49.7
TC.S10	Sweet beverage consumption		BD	Percentage of children age 6-23 months who consumed sweet beverage during the previous day	38.6
TC.S11	Unhealthy food consumption		BD	Percentage of children age 6-23 months who consumed unhealthy food during the previous day	34.6
TC.S12	Zero vegetable or fruit consumption		BD	Percentage of children age 6-23 months who did not consume any vegetable or fruit during the previous day	35.3
TC.44a TC.44b	Underweight prevalence		AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median weight for age of the WHO standard	5.0 1.3

⁴⁰ The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

⁴¹ Breastfeeding children: Solid, semi-solid, or soft foods, two times for infants age 6-8 months, and three times for children 9-23 months; Non-breastfeeding children: Solid, semi-solid, or soft foods, or milk feeds, four times for children age 6-23 months

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
TC.45a TC.45b	Stunting prevalence	2.2.1	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) below minus three standard deviations (severe) of the median height for age of the WHO standard	20.0 4.9
TC.46a TC.46b	Wasting prevalence	2.2.2	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median weight for height of the WHO standard	1.8 0.5
TC.47a TC.47b	Overweight prevalence	2.2.2	AN	Percentage of children under age 5 who are above (a) two standard deviations (moderate and severe) (b) three standard deviations (severe) of the median weight for height of the WHO standard	9.8 2.2
TC.48	Iodized salt consumption		SA	Percentage of households with salt testing positive for any iodide/iodate among households in which salt was tested or where there was no salt	87.5
TC.49a TC.49b TC.49c	Early stimulation and responsive care		EC	Percentage of children age 24-59 months engaged in four or more activities to provide early stimulation and responsive care in the last 3 days with (a) Any adult household member (b) Father (c) Mother	30.7 1.4 14.6
TC.50	Availability of children's books		EC	Percentage of children under age 5 who have three or more children's books	2.4
TC.51	Availability of playthings		EC	Percentage of children under age 5 who play with two or more types of playthings	63.2
TC.52	Inadequate supervision		EC	Percentage of children under age 5 left alone or under the supervision of another child younger than 10 years of age for more than one hour at least once in the last week	13.7
TC.53	Early childhood development index 2030	4.2.1	EC	Percentage of children 24-59 months who are developmentally on track in health, learning and psychosocial well-being	48.0

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value

PROTECTED FROM VIOLENCE AND EXPLOITATION				
PR.1	16.9.1	BR	Percentage of children under age 5 whose births are reported registered with a civil authority	65.7
PR.2	16.2.1	UCD – FCD	Percentage of children age 1-14 years who experienced any physical punishment and/or psychological aggression by caregivers in the past one month	79.4
PR.3	8.7.1	CL	Percentage of children age 5-17 years who are involved in child labour ⁴²	13.6
PR.S1		CL	Percentage of children age 5-17 years who are involved in animal herding activities	41.2
PR.4a PR.4b	5.3.1	MA	Percentage of women and men age 20-24 years who were first married or in union Women (a) before age 15 (b) before age 18 Men (a) before age 15 (b) before age 18	0.1 1.9 0.0 0.0
PR.5		MA	Percentage of women and men age 15-19 years who are married or in union Women Men	3.0 0.0
PR.6		MA	Percentage of women and men age 15-49 years who are in a polygynous union Women Men	8.3 6.9

⁴² Child labourers are defined as children involved in economic activities or in household chores above the age-specific thresholds. While the concept of child labour includes exposure to hazardous working conditions, and this is collected in MICS and was previously included in the reported indicator, the present definition, which is also used for SDG reporting, does not include children who are working under hazardous conditions. See Tables PR.3.1-4 for more detailed information on thresholds and classifications.

MICS INDICATOR		SDG ¹	Module ²	Description ³	Value
PR.12	Experience of robbery and assault		VT	Percentage of women and men age 15-49 years who experienced physical violence of robbery or assault within the last 12 months Women Men	5.1 6.4
PR.13	Crime reporting ⁴³	16.3.1	VT	Percentage of women and men age 15-49 years experiencing physical violence of robbery and/or assault in the last 12 months and reporting the last incidences of robbery and/or assault experienced to the police Women Men	55.7 56.0
PR.14	Safety	16.1.4	VT	Percentage of women and men age 15-49 years feeling safe walking alone in their neighbourhood after dark Women Men	33.8 76.7
PR.15	Attitudes towards domestic violence		DV	Percentage of women and men age 15-49 years who state that a husband is justified in hitting or beating his wife in at least one of the following circumstances: (1) she goes out without telling him, (2) she neglects the children, (3) she argues with him, (4) she refuses sex with him, (5) she burns the food Women Men	8.1 5.7
PR.S2	Attitudes towards domestic violence		DV	Percentage of women and men age 15-49 years who state that a husband is justified in hitting or beating his wife in at least one of the following circumstances: (1) she goes out without telling him, (2) she neglects the children, (3) she argues with him, (4) she refuses sex with him, (5) she burns the food, (6) she rejects or ends the relationship with him, (7) she sleeps with another man, (8) she initiates sex, (9) she refuses to give food Women Men	12.1 8.1

⁴³ Due a low percentage of men and women age 15-49 years who experienced robbery in the last year, this indicator is presented only here and no disaggregate is available

EQ.11a EQ.11b	Perception of a better life		LS	Percentage of women and men whose life improved during the last one year and who expect that their life will be better after one year Women (a) age 15-24 (b) age 15-49 Men (a) age 15-24 (b) age 15-49	42.1 40.2 37.8 34.5

4.1 RESULTS OF INTERVIEWS

Table SR.1.1 presents results of the sample implementation, including response rates. Of the 5,265 households selected for the sample, 4,891 were found occupied. Of these, 4,675 were successfully interviewed for a household response rate of 95.6 percent.

The Water Quality Testing Questionnaire was administered to 1,404 randomly selected households in each cluster. Of these, 1,224 were successfully tested for household drinking water yielding a response rate of 94.2 percent. Also, 1,168 were successfully tested for source drinking water quality yielding a response rate of 89.9 percent.

In the interviewed households, 4,575 women (age 15-49 years) were identified. Of these, 4,294 were successfully interviewed, yielding a response rate of 93.9 percent within the interviewed households.

The survey also sampled men (age 15-49), but required only a subsample. All men (age 15-49) were identified in every second household. 4,401 men (age 15-49 years) were listed in the household questionnaires. Questionnaires were completed for 1,658 eligible men, which corresponds to a response rate of 82.8 percent within eligible interviewed households.

There were 2,310 children under age five listed in the household questionnaires. Questionnaires were completed for 2,251 of these children, which corresponds to a response rate of 97.4 percent within interviewed households.

A sub-sample of children age 5-17 years was used to administer the questionnaire for children age 5-17. Only one child has been selected randomly in each household interviewed, and there were 5,890 children age 5-17 years listed in the household questionnaires. Of these, 2,551 children were selected, and questionnaires were completed for 2,490 which corresponds to a response rate of 97.6 percent within the interviewed households.

Overall response rates of 89.7, 79.1, 93.1, 93.3 are calculated for the individual interviews of women, men, under-5s, and children age 5-17 years, respectively.

Table SR.1.1: Results of household, household water quality testing, women's, men's, under-5's and children age 5-17's interviews

Number of households, households selected for water quality testing, women, men, children under 5, and children age 5-17 by interview results, by area of residence and region, Eswatini MICS, 2021-2022

Children age 5-17's overall response rate	93.3	88.3	94.7	93.9	87.6	96.8	96.8

^A The Water Quality Testing Questionnaire was administered to 4 randomly selected households in each cluster. The response rate within completed households is presented in Table DQ.3.2.

^B The Individual Questionnaire for Men was administered to all men age 15-49 years in every second household

^C The Questionnaire for Children Age 5-17 was administered to one randomly selected child in each interviewed household

4.2 HOUSING AND HOUSEHOLD CHARACTERISTICS

Tables SR.2.1, SR.2.2 and SR.2.3 provide further details on household level characteristics obtained in the Household Questionnaire. Most of the information collected on these housing characteristics have been used in the construction of the wealth index.

Table SR.2.1 presents characteristics of housing, disaggregated by area and region, distributed by whether the dwelling has electricity, energy used for cooking, internet access, the main materials of the flooring, roof, and exterior walls, as well as the number of rooms used for sleeping.

In Table SR.2.2 households are distributed according to ownership of assets by households and by individual household members. This also includes ownership of dwelling.

Table SR.2.3 shows how the household populations in areas and regions are distributed according to household wealth quintiles.

Table SR.2.1: Housing characteristics

4.3 HOUSEHOLD COMPOSITION

Tables SR.3.1 provides the distribution of households by selected background characteristics, including the sex of the household head, region, area, number of household members, education of household head, and mean household size⁴⁴. Both unweighted and weighted numbers are presented. Such information is essential for the interpretation of findings presented later in the report and provide background information on the representativeness of the survey sample. The remaining tables in this report are presented only with weighted numbers.⁴⁵

The presented background characteristics are used in subsequent tables in this report; the figures in the table are also intended to show the numbers of observations by major categories of analysis in the report.

The weighted and unweighted total number of households are equal, since sample weights were normalized⁴⁵. The table also shows the weighted mean household size estimated by the survey.

⁴⁴ This was determined by asking the total number of household members in each household and the total number of households with completed interviews. These variables were chosen because were easily obtained. The mean household size indicator is a key determinant of underlying demand for housing.

⁴⁵ See Appendix A: Sample design, for more details on sample weights.

Table SR.3.1: Household composition

Percent and frequency distribution of households, Eswatini MICS, 2021-2022

	Weighted percent	Number of households	
		Weighted	Unweighted
Total	100.0	4,675	4,675

At least one child age <18 years	56.8	2,656	2,919
At least one woman age 15-49 years	62.4	2,916	3,018
At least one man age 15-49 years	62.3	2,911	2,907
No member age <50	8.6	403	403
No adult (18+) member	0.4	18	18
Mean household size	3.7	4,675	4,675

^A Each proportion is a separate characteristic based on the total number of households

4.4 AGE STRUCTURE OF HOUSEHOLD POPULATION

The weighted age and sex distribution of the survey population is provided in Table SR.4.1. In the households successfully interviewed in the survey, a weighted total of 17,110 household members were listed. Of these, 8,317 were males, and 8,793 were females.⁴⁶

⁴⁶ The single year age distribution is provided in Table DQ.1.1 in Appendix D: Data quality

Table SR.4.1: Age distribution of household population by sex

Percent and frequency distribution of the household population^A in five-year age groups and child (age 0-17 years) and adult populations (age 18 or more), by sex, Eswatini MICS, 2021-2022

	Males		Females		Total

55-59	207	2.5	305	3.5	512	3.0
60-64	195	2.3	233	2.7	428	2.5
65-69	139	1.7	182	2.1	320	1.9
70-74	90	1.1	134	1.5	225	1.3
75-79	55	0.7	118	1.3	173	1.0
80-84	47	0.6	70	0.8	117	0.7
85+	20	0.2	57	0.6	76	0.4
Child and adult populations						
Children age 0-17 years	3,612	43.4	3,540	40.3	7,152	41.8
Adults age 18+ years	4,705	56.6	5,254	59.7	9,958	58.2

^A As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those found for individuals in tables SR.5.1W/M, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights.

4.5 RESPONDENTS' BACKGROUND CHARACTERISTICS

Tables SR.5.1W, SR.5.1M, SR.5.2, and SR.5.3 provide information on the background characteristics of female and male respondents 15-49 years of age, children under age 5 and children age 5-17 years. In all these tables, the total numbers of weighted and unweighted observations are equal, since sample weights have been normalized (standardized)⁴⁵. Note that in Table SR.5.3, an additional column is presented (Weighted total number of children age 5-17 years) to account for the random selection of one child in households with at least one child age 5-17 years. The final weight of each child is the weight of the household multiplied by the number of children age 5-17 years in the household.

In addition to providing useful information on the background characteristics of women, men, children age 5-17, and children under age five, the tables are also intended to show the numbers of observations in each background category. These categories are used in the subsequent tabulations of this report.

Tables SR.5.1W and SR.5.1M provide background characteristics of female and male respondents, age 15-49 years. The tables include information on the distribution of women and men according to area, region, age, education⁴⁷, marital/union status, motherhood/fatherhood status, functional difficulties (for age 18-49) and wealth index quintiles.^{48, 49}

⁴⁷ Throughout this report when used as a background variable, unless otherwise stated, "education" refers to highest educational level ever attended by the respondent.

⁴⁸ The wealth index is a composite indicator of wealth. To construct the wealth index, principal components analysis is performed by using information on the ownership of consumer goods, dwelling characteristics, water and sanitation, and other characteristics that are related to the household's wealth, to generate weights (factor scores) for each of the items used. First, initial factor scores are calculated for the total sample. Then, separate factor scores are calculated for households in urban and rural areas. Finally, the urban and rural factor scores are regressed on the initial factor scores to obtain the combined, final factor scores for the total sample. This is carried out to minimize the urban bias in the wealth index values. Each household in the total sample is then assigned a wealth score based on the assets owned by that household and on the final factor scores obtained as described above. The survey household population is then ranked according to the wealth score of the household they are living in, and is finally divided into 5 equal parts (quintiles) from lowest (poorest) to highest (richest). In Eswatini MICS, the following assets were used in these calculations: type of floor, roof, wall, Household assets – 1 (Fixed telephone line, Radio, Table, Chair, Wardrobe, Bed, sofa, Cupboard, Manual grinding machine, non-Electric iron, Paraffin stove, Cooking stand, Bush knife, Sleeping mat (Licansi)), Electricity, Household assets – 2 (Television, Refrigerator, Electric stove, Geysers, Fan, Food blender, Electric kettle, Electric iron, Hot plate, Water heater element/bucket), Household members assets (Wristwatch, Bicycle, Motorcycle/scooter, Animal drawn cart, Car/truck/van, Boat with motor, Tractor, Animal drawn plough, Wheelbarrow, Hoe), Computer / Mobile / Internet, Land ownership, Ownership of livestock, Bank ACCOUNT. The wealth index is assumed to capture the underlying long-term wealth through information on the household assets, and is intended to produce a ranking of households by wealth, from poorest to richest. The wealth index does not provide information on absolute poverty, current income or expenditure levels. The wealth scores calculated are applicable for only the particular data set they are based on. Further information on the construction of the wealth index can be found in:

Filmer, D., and L. Pritchett. "Estimating Wealth Effects without Expenditure Data — or Tears: An Application to Educational Enrollments in States of India*." *Demography* 38, no. 1 (2001): 115-32. doi:10.1353/dem.2001.0003.;

⁴⁹ When describing survey results by wealth quintiles, appropriate terminology is used when referring to individual

Background characteristics of children age 5-17 and under 5 are presented in Tables SR.5.2 and SR.5.3. These include the distribution of children by several attributes: sex, area, region, age in months, mother's (or caretaker's) education, respondent type, functional difficulties (for children under age 5 only for age 2-4 years) and wealth index quintiles.

household members, such as for instance "women in the richest population quintile", which is used interchangeably with "women in the wealthiest survey population", "women living in households in the richest population wealth quintile", and similar.

Table SR.5.1W: Women's background characteristics

Percent and frequency distribution of women age 15-49 years, Eswatini MICS, 2021-2022

Fourth	18.3	411	394
Richest	16.2	364	299

^A In this table and throughout the report where applicable, mother's education refers to educational attainment of the respondent: Mothers (or caretakers, interviewed only if the mother is deceased or is living elsewhere).

^B The results of the Child Functioning module are presented in Chapter 11.1.

^C Children age 0-1 years are excluded, as functional difficulties are only collected for age 2-4 years.

^D In this table and throughout the report, mother's functional difficulties refer to functional difficulty of the respondent as described in note A. The category of "No information" applies to mothers or caretakers to whom the Adult Functioning module was not administered. This category is not presented in individual tables. Please refer to Tables 8.1W and 8.1M for results of the Adult Functioning module.

Table SR.5.3: Children age 5-17 years' background characteristics

Fourth	19.7	1,097	486	471
Richest	17.7	985	526	447

^A As one child is randomly selected in each household with at least one child age 5-17 years, the final weight of each child is the weight of the household multiplied with the number of children age 5-17 years in the household. This column is the basis for the weighted percent distribution, i.e. the distribution of all children age 5-17 years in sampled households.

^B In this table and throughout the report where applicable, mother's education refers to educational attainment of the respondent: Mothers (or caretakers, interviewed only if the mother is deceased or is living elsewhere). The category of "Emancipated" applies to children age 15-17 years as described in note C. This category is not presented in individual tables.

^C Children age 15-17 years were considered emancipated and individually interviewed if not living with his/her mother and the respondent to the Household Questionnaire indicated that the child does not have a primary caretaker.

^D The results of the Child Functioning module are presented in Chapter 11.1.

^E In this table and throughout the report, mother's functional difficulties refer to functional difficulty of the respondent as described in note B. The category of "No information" applies to mothers or caretakers to whom the Adult Functioning module was not administered. Emancipated children are also included in this category. This category is not presented in individual tables. Please refer to Tables 8.1W and 8.1M for results of the Adult Functioning module.

4.6 LITERACY

The literacy rate reflects the outcomes of primary education over the previous 30-40 years. As a measure of the effectiveness of the primary education system, it is often seen as a proxy measure of social progress and economic achievement. In MICS, literacy is assessed on the ability of the respondent to read a short simple statement or based on school attendance.

Tables SR.6.1W and SR.6.1M show the survey findings for the total number of interviewed women and men, respectively. The Youth Literacy Rate, MICS Indicator SR.2, is calculated for women and men age 15-24 years and presented in the Age disaggregate in the two tables.

Note that those who have ever attended lower secondary or higher education are immediately classified as literate, due to their education level and are therefore not asked to read the statement. All others who successfully read the statement are also classified as literate. The tables are designed as full distributions of the survey respondents, by level of education ever attended. The total percentage literate presented in the final column is the sum of literate individuals among those with 1) pre-primary or no education, 2) primary education and 3) those with at least some secondary education.

The percent missing includes those for whom no sentence in the required language was available or for whom no response was reported.

Table SR.6.1W: Literacy (women)

Percent distribution of women age 15-49 years by highest level of school attended and literacy, and the total percentage literate, Eswatini MICS, 2021-2022

4.7 MIGRATORY STATUS

The Background module of the Eswatini MICS, 2021-2022 asked respondents to the Individual Questionnaire for Women and Men how long they have been continuously living in the current residence and, if they were not living there since birth, whether they lived in a city, town or rural area and the name of the region they lived in before moving to their current place of residence. Tables SR.7.1W and 7.1.M present the percentage of women and men who have changed residence according to the time since last move and also compares the place of residence of each individual at the time of the survey with that of the last place of residence and the type of residence.

Table SR.7.1W: Migratory status (women)

Percent distribution of women age 15-49 years by migratory status and years since last migration, and percent distribution of women who migrated, by type and place of last residence, Eswatini MICS, 2021-2022

4.8 ADULT FUNCTIONING

The Adult Functioning module is based on the “short set” of questions developed by the Washington Group on Disability Statistics (WG) – a UN City Group established under the United Nations Statistical Commission. These questions reflect six domains for measuring disability: seeing, hearing, walking, cognition, self-care and communication. This module is recommended for disaggregation of SDG indicators for adults.⁵⁰

The MICS6 standard questionnaires include these questions in the individual questionnaires as specified previously. For women and men age 18-49, data are obtained directly from the respondents themselves.⁵¹

Information at the individual level can also be obtained through a proxy respondent using a roster approach of these questions in the household questionnaire. This would necessitate a single proxy respondent answering on behalf of all adult household members. A proxy respondent can identify a large proportion of difficulties, but tend to under-identify persons with functional difficulties, either deliberately or inadvertently.⁵²

Self-reporting too can have methodological issues. Specifically, a self-reported approach can bias the total sample, as some individuals cannot be interviewed due to their disability (labeled as “incapacitated” in the result code of the individual questionnaires by the interviewers). The number of “incapacitated” individuals identified in household surveys is generally very low (usually around 0.5%) and holds both those incapacitated for reasons of disability and those incapacitated for any reason (e.g., sick in bed).

Regardless, to avoid such potential bias, the Adult Functioning data in MICS should not be used to estimate prevalence in the household population age 18-49 years. The standard tabulations of MICS do therefore not include such. These data are however the recommended methodology to allow countries to disaggregate the SDG indicators by disability status – the objective behind the inclusion of the module. It is important to interpret the disaggregate with the bias in mind: The data is representative for the household population age 18-49 for which an interview was completed and functioning difficulty is sometimes the reason for incomplete questionnaires.

The recommendation of the WG is to use a proxy respondent for those individuals who cannot respond for themselves, as this would allow estimation of prevalence in the household population age 18-49 years. This approach is not currently sought by MICS, as the majority of data captured in individual questionnaires cannot be collected through a proxy respondent (e.g. the SDG indicators on fertility, child mortality, family planning, delivery attendance, maternal mortality, early marriage, FGM, etc.).

⁵⁰ I.A.E.G.-SDG's. *Disability Data Disaggregation*. Joint Statement by the Disability Sector, Geneva, 2016.

<http://www.washingtongroup-disability.com/wp-content/uploads/2016/01/Joint-statement-on-disaggregation-of-data-by-disability-Final.pdf>.

⁵¹ Note that the Adult Functioning module does not cover adults over age 49 years which is the population most at risk of having a functional limitation due to aging.

⁵² "Using the Washington Group Tools for the First Time." Washington Group on Disability Statistics. Accessed August 24, 2018. <http://www.washingtongroup-disability.com/frequently-asked-questions/using-the-wg-questions-for-the-first-time/>.

Tables SR.8.1W and SR.8.1M present the percentage of women and men age 18-49 years with functional difficulties, by domain, and percentage who use assistive devices and have functional difficulty within each domain (seeing, hearing, walking, self-care, communication, and remembering).

Table SR.8.1W: Adult functioning (women age 18-49 years)

^A In MICS, the adult functioning module is asked to individual respondents age 18-49 for the purpose of disaggregation. No information is collected on eligible household members who, for any reason, were unable to complete the interview. It is expected that a significant proportion of 0 cases of respondents for whom the response code "Incapacitated" was indicated for the individual interview are indeed incapacitated due to functional difficulties. The percentage of women with functional difficulties presented here is therefore not representing a full measure and should not be used for reporting on prevalence in the population.

^B The category of "Vocational" in the background characteristic of "Education" has been suppressed from the table due to a small number of unweighted cases

4.9 MASS MEDIA AND ICT

The Eswatini MICS collected information on exposure to mass media and the use of computers and the internet. Information was collected on exposure to newspapers/magazines, radio and television among women and men age 15-49 years and is presented in Tables SR.9.1W and SR.9.1M.

In Table SR.9.2 presents information on the household ownership of Information and Communication Technology (ICT) equipment (radio, television, fixed telephone line or mobile telephone⁵³ and computer) and access to internet.

Table SR.9.CS1 presents household coverage of radio and television

Tables SR.9.3W and SR.9.3M present the use of ICT by women and men age 15-49 years based on the information about whether they have ever used computers, mobile phones or internet and during the last three months while tables SR.9.4W and SR.9.4M present the ICT skills of women and men age 15-49 years based on the information about whether they carried out computer related activities in the last three months. Tables SR.9.CS2W and SR.9.2M present the exposure to social media for women and men age 15-49 years.

⁵³ In addition to the specific question in the Household Questionnaire about whether any member of this household has a mobile phone, households are considered as owning mobile phone if any individual woman (or man) age 15-49 years responded yes to the question about ownership of mobile telephones in the individual questionnaires for women and men age 15-49 years.

4.10 TOBACCO AND ALCOHOL USE

Tobacco products are products made entirely or partly of leaf tobacco as raw material, which are intended to be smoked, sucked, chewed, or snuffed. All contain the highly addictive psychoactive ingredient, nicotine. Tobacco use is one of the main risk factors for a number of chronic diseases, including cancer, lung diseases, and cardiovascular diseases.⁵⁴ If mentioned, e-cigarettes are included in the other response category of smokeless tobacco product use.

The consumption of alcohol carries a risk of adverse health and social consequences related to its intoxicating, toxic and dependence-producing properties. In addition to the chronic diseases that may develop in those who drink large amounts of alcohol over a number of years, alcohol use is also associated with an increased risk of acute health conditions, such as injuries, including from traffic accidents.⁵⁵ Alcohol use also causes harm far beyond the physical and psychological health of the drinker. It harms the well-being and health of people around the drinker. An intoxicated person can harm others or put them at risk of traffic accidents or violent behaviour, or negatively affect co-workers, relatives, friends or strangers. Thus, the impact of the harmful use of alcohol reaches deep into society.⁵⁶

The Eswatini MICS collected information on ever and current use of tobacco and alcohol and intensity of use among women and men age 15-49 years. This section presents the main results.

Table SR.10.CS1W presents the current and ever use of tobacco products by women age 15-49 years, and Table SR.10.CS1M presents the corresponding information for men of the same age group.

4.11 CHILDREN'S LIVING ARRANGEMENTS

The Convention on the Rights of the Child (CRC) recognizes that “the child, for the full and harmonious development of his or her personality, should grow up in a family environment, in an atmosphere of happiness, love and understanding”. Millions of children around the world grow up without the care of their parents for several reasons, including due to the premature death of the parents or their migration for work. In most cases, these children are cared for by members of their extended families, while in others, children may be living in households other than their own, as live-in domestic workers for instance. Understanding the children’s living arrangements, including the composition of the households in which they live and the relationships with their primary caregivers, is key to design targeted interventions aimed at promoting child’s care and wellbeing.

Table SR.11.1 presents information on the living arrangements and orphanhood status of children under age 18.

The Eswatini MICS, 2021-2022 included a simple measure of one particular aspect of migration related to what is termed “children left behind”, i.e. for whom one or both parents have moved abroad. While the amount of literature is growing, the long-term effects of the benefits of remittances versus the potential adverse psycho-social effects are not yet conclusive, as there is somewhat conflicting evidence available as to the effects on children. Table SR.11.2 presents information on the living arrangements and co-residence with parents of children under age 18.

Table SR.11.3 presents information on children under age 18 years not living with a biological parent according to relationship to the head of household and those living in households headed by a family member.

Table SR.11.1: Children's living arrangements and orphanhood

¹ MICS indicator SR.18 - Children's living arrangements

^A Excludes households headed by the child, servants and other not related

¹ '-' denotes 0 unweighted case in the denominator

With the SDG target (3.2) for child mortality, on ending preventable deaths of newborns and children under 5 years of age, the international community has retained the overarching goal of reducing child mortality. While the global target calls for reducing neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to at least as low as 25 deaths per 1,000 live births, reduction of child mortality continues to be one of the most important objectives in national plans and programmes in each and every country.

Mortality rates presented in this chapter are calculated from information collected in the birth histories of the Women's Questionnaires. All interviewed women were asked whether they had ever given birth, and those who had were asked to report the number of sons and daughters who live with them, the number who live elsewhere, and the number who have died. In addition, women were asked to provide detailed information on their live births, starting with the firstborn, in chronological order. This information included whether births were single or multiple, and for each live birth, sex, date of birth (month and year), and survival status. Further, for children alive at the time of survey, women were asked the current age of the child; for deceased children, the age at death was obtained. Childhood mortality rates are expressed by conventional age categories and are defined as follows:

- Neonatal mortality (NN): probability of dying within the first month of life⁵⁷
- Post-neonatal mortality (PNN): difference between infant and neonatal mortality rates
- Infant mortality (${}_1q_0$): probability of dying between birth and the first birthday
- Child mortality (${}_4q_1$): probability of dying between the first and the fifth birthdays
- Under-five mortality (${}_5q_0$): the probability of dying between birth and the fifth birthday

Neonatal, infant and under-five mortality rates are expressed as deaths per 1,000 live births. Child mortality is expressed as deaths per 1,000 children surviving to age one. Post-neonatal mortality is calculated as the difference between infant and neonatal mortality rates.

Table CS.1 presents neonatal, post-neonatal, infant, child, and under-five mortality rates for the three most recent ten-year periods before the survey. For each mortality rate in the table, it is possible to assess changes over time, during the last 30 years preceding the survey.

Tables CS.2 and CS.3 provide estimates of child mortality by socioeconomic and demographic characteristics. Using the rates calculated for the 10-year period immediately preceding the survey, differentials in mortality rates by socioeconomic characteristics, such as region, mother's education and wealth, and by demographic characteristics such as sex and mother's age at birth are presented.

⁵⁷ The neonatal period is the first 28 days of life, however, traditionally the neonatal mortality rates are computed based on the first month of life in household surveys, which very closely approximates the 28-day definition.

6.1 FERTILITY

Measures of current fertility are presented in Table TM.1.1 for the three-year period preceding the survey. A three-year period was chosen for calculating these rates to provide the most current information, while also allowing the rates to be calculated for a sufficient number of cases so as not to compromise the statistical precision of the estimates. The current fertility measures, presented in the table by urban and rural residence, are as follows:

- Age-specific fertility rates (ASFRs), expressed as the number of births per 1,000 women in a specified age group, show the age pattern of fertility. Numerators for ASFRs are calculated by identifying live births that occurred in the three-year period preceding the survey, classified according to the age of the mother (in five-year age groups) at the time of the child's birth. Denominators of the rates represent the number of woman-years lived by all interviewed women (or in simplified terms, the average number of women) in each of the five-year age groups during the specified period.
- The total fertility rate (TFR) is a synthetic measure that denotes the number of live births a woman would have if she were subject to the current age-specific fertility rates throughout her reproductive years (15-49 years).
- The general fertility rate (GFR) is the number of live births occurring during the specified period per 1,000 women age 15-49.
- The crude birth rate (CBR) is the number of live births per 1,000 household population during the specified period.

Table TM.1.1: Fertility rates

¹ MICS indicator TM.1 - Adolescent birth rate (age 15-19 years); SDG indicator 3.7.2

^A The age-specific fertility rates (ASFR) are the number of live births in the last 3 years, divided by the average number of women in that age group during the same period, expressed per 1,000 women. The age-specific fertility rate for women age 15-19 years is also termed as the adolescent birth rate

^B TFR: The Total Fertility Rate is the sum of age-specific fertility rates of women age 15-49 years. The TFR denotes the average number of children to which a woman will have given birth by the end of her reproductive years (by age 50) if current fertility rates prevailed. The rate is expressed per woman age 15-49 years

^C GFR: The General Fertility Rate is the number of births in the last 3 years divided by the average number of women age 15-49 years during the same period, expressed per 1,000 women age 15-49 years

^D CBR: The Crude Birth Rate is the number of births in the last 3 years, divided by the total population during the same period, expressed per 1,000 population

6.2 EARLY CHILDBEARING

Table TM.2.1 presents the survey findings on adolescent birth rates and further disaggregates of the total fertility rate.

The adolescent birth rate (age-specific fertility rate for women age 15-19) is defined as the number of births to women age 15-19 years during the three-year period preceding the survey, divided by the average number of women age 15-19 (number of women-years lived between ages 15 through 19, inclusive) during the same period, expressed per 1,000 women.

The adolescent birth rate is a Global SDG indicator (3.7.2) for ensuring universal access to sexual and reproductive health-care services (Target 3.7).

Tables TM.2.2W and TM.2.2M present a selection of early childbearing and fatherhood indicators for young women and men age 15-19 and 20-24 years. In Table TM.2.2W, percentages among women age 15-19 who have had a live birth and those who are pregnant with their first child are presented. For the same age group, the table also presents the percentage of women who have had a live birth before age 15. These estimates are all derived from the detailed birth histories of women.

To estimate the proportion of women who have had a live birth before age 18 – when they were still children themselves – data based on women age 20-24 years at the time of survey are used to avoid truncation.⁵⁸

Table TM.2.2M presents findings on early fatherhood. Percentages among men age 15-19 and age 20-24 years who became fathers before ages 15 and 18, respectively, show the extent to which men are becoming fathers when they are still children.

Tables TM.2.3W and TM.2.3M are designed to look at trends in early childbearing for women and early fatherhood for men, by presenting percentages of women and men who became mother and fathers before ages 15 and 18, for successive age cohorts. The table is designed to capture trends in urban and rural areas separately.

⁵⁸ Using women age 15-19 to estimate the percentage who had given birth before age 18 would introduce truncation to the estimates, since the majority of women in this age group will not have completed age 18, and therefore will not have completed exposure to childbearing before age 18. The age group 20-24 is used to estimate the percentage of women giving birth before age 18, since all women in this age group have completed exposure to childbearing at very early ages.

6.3 CONTRACEPTION

Appropriate contraceptive use is important to the health of women and children by: 1) preventing pregnancies that are too early or too late; 2) extending the period between births; and 3) limiting the total number of children.⁵⁹

Table TM.3.1 presents the current use of contraception for women who are currently married or in union while Table TM.3.2 presents the same information for women who are not currently married or in union and are sexually active. In Table TM.3.1, use of specific methods of contraception are first presented; specific methods are then grouped into modern and traditional methods and presented as such. For sexually active women who are not currently married or in union, in Table TM.3.2, contraceptive use is only presented by modern and traditional method categories.

Unmet need for contraception refers to fecund women who are not using any method of contraception, but who wish to postpone the next birth (spacing) or who wish to stop childbearing altogether (limiting). Unmet need is identified in MICS by using a set of questions eliciting current behaviours and preferences pertaining to contraceptive use, fecundity, and fertility preferences.

Table TM.3.3 shows the levels of unmet need and met need for contraception, and the demand for contraception satisfied for women who are currently married or in union. The same table is reproduced in Table 3.4 for sexually active women who are not currently married or in union.

Unmet need for spacing is defined as the percentage of women who are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrheic⁶⁰ and iii) fecund⁶¹ and say they want to wait two or more years for their next birth OR
- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and unsure whether they want another child OR
- are pregnant, and say that pregnancy was mistimed (would have wanted to wait) OR
- are post-partum amenorrheic and say that the birth was mistimed (would have wanted to wait).

⁵⁹ PATH, and United Nations Population Fund. *Meeting the Need: Strengthening Family Planning Programs*. Seattle: PATH/UNFPA, 2006. https://www.unfpa.org/sites/default/files/resource-pdf/family_planning06.pdf.

⁶⁰ A woman is post-partum amenorrheic if she had a live birth in last two years and is not currently pregnant, and her menstrual period has not returned since the birth of the last child.

⁶¹ A woman is considered infecund if she is neither pregnant nor post-partum amenorrheic, and (1a) has not had menstruation for at least six months, or (1b) has never menstruated, or (1c) had last menstruation occurring before her last birth, or (1d) is in menopause/has had hysterectomy OR (2) she declares that she i) has had hysterectomy, ii) has never menstruated, iii) is menopausal or iv) has been trying to get pregnant for at least 2 years without result in response to questions on why she thinks she is not physically able to get pregnant at the time of survey OR (3) she declares she cannot get pregnant when asked about desire for future birth OR (4) she has not had a birth in the preceding 5 years, is currently not using contraception and is currently married and was continuously married during the last 5 years preceding the survey.

Unmet need for limiting is defined as percentage of women who are married or in union and are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and say they do not want any more children OR
- are pregnant and say they did not want to have a child OR
- are post-partum amenorrheic and say that they did not want the birth.

Total unmet need for contraception is the sum of unmet need for spacing and unmet need for limiting.

Met need for limiting includes women who are using (or whose partner is using) a contraceptive method⁶² and who want no more children, are using male or female sterilisation or declare themselves as infecund. Met need for spacing includes women who are using (or whose partner is using) a contraceptive method and who want to have another child or are undecided whether to have another child. Summing the met need for spacing and limiting results in the total met need for contraception.

Using information on contraception and unmet need, the percentage of demand for contraception satisfied is also estimated from the MICS data. The percentage of demand satisfied is defined as the proportion of women who are currently using contraception over the total demand for contraception. The total demand for contraception includes women who currently have an unmet need (for spacing or limiting) plus those who are currently using contraception.

Percentage of demand for family planning satisfied with modern methods is one of the indicators used to track progress toward the Sustainable Development Goal, Target 3.7, on ensuring universal access to sexual and reproductive health-care services, including for family planning, information and education and the integration of reproductive health into national strategies and programmes. While SDG indicator 3.7.1 relates to all women age 15-49 years, it is only reported for women currently married or in union and, therefore, located in Table TM.3.3 alone.

⁶² In this chapter, whenever reference is made to the use of a contraceptive by a woman, this includes her partner using a contraceptive method (such as male condom)

Table TM.3.1: Use of contraception (currently married/in union)

Percentage of women age 15-49 years currently married or in union who are using (or whose partner is using) a contraceptive method, who sought the most recent source of method from health facility, and whose partner is aware that she is currently using a contraceptive method, Eswatini MICS, 2021-2022

6.4 ANTENATAL CARE

The antenatal period presents important opportunities for reaching pregnant women with a number of interventions that may be vital to their health and well-being and that of their infants. For example, antenatal care can be used to inform women and families about risks and symptoms in pregnancy and about the risks of labour and delivery, and therefore it may provide the route for ensuring that pregnant women do, in practice, deliver with the assistance of a skilled health care provider. Antenatal visits also provide an opportunity to supply information on birth spacing, which is recognised as an important factor in improving infant survival.

WHO recommends a minimum of eight antenatal visits based on a review of the effectiveness of different models of antenatal care.⁶³ WHO guidelines are specific on the content on antenatal care visits, which include:

- Blood pressure measurement
- Urine testing for bacteriuria and proteinuria
- Blood testing to detect syphilis and severe anaemia
- Weight/height measurement (optional)
- Tuberculosis screening (optional)

It is of crucial importance for pregnant women to start attending antenatal care visits as early in pregnancy as possible and ideally have the first visit during the first trimester to prevent and detect pregnancy conditions that could affect both the woman and her baby. Antenatal care should continue throughout the entire pregnancy⁶³

Antenatal care is a tracer indicator of the Reproductive and Maternal Health Dimension of SDG 3.8 Universal Health Coverage. The type of personnel providing antenatal care to women age 15-49 years who gave birth in the two years preceding is presented in Table TM.4.1.

Table TM.4.2 shows the number of antenatal care visits during the pregnancy of their most recent birth within the two years preceding the survey, regardless of provider, by selected characteristics. Table TM.4.2 also provides information about the timing of the first antenatal care visit.

The coverage of key services that pregnant women are expected to receive during antenatal care are shown in Table TM.4.3.

⁶³ WHO. *WHO recommendations on antenatal care for a positive pregnancy experience*. Geneva: WHO Press, 2016. <http://apps.who.int/iris/bitstream/handle/10665/250796/9789241549912-eng.pdf?sequence=1>.

6.5 NEONATAL TETANUS

Tetanus immunisation during pregnancy can be life-saving for both the mother and the infant.⁶⁴ WHO estimated that neonatal tetanus killed more than 31,000 newborn children in 2016 within their first month of life.⁶⁵

SDG 3.1 aims at reducing by 2030 the global maternal mortality ratio to less than 70 per 100,000 live births. Eliminating maternal tetanus is one of the strategies used to achieve SDG target 3.1.

The strategy for preventing maternal and neonatal tetanus is to ensure that all pregnant women receive at least two doses of tetanus toxoid vaccine. If a woman has not received at least two doses of tetanus toxoid during a particular pregnancy, she (and her newborn) are also considered to be protected against tetanus if the woman:

- Received at least two doses of tetanus toxoid vaccine, the last within the previous 3 years;
- Received at least 3 doses, the last within the previous 5 years;
- Received at least 4 doses, the last within the previous 10 years;
- Received 5 or more doses anytime during her life.⁶⁶

To assess the status of tetanus vaccination coverage, women who had a live birth during the two years before the survey were asked if they had received tetanus toxoid injections during the pregnancy for their most recent birth, and if so, how many. Women who did not receive two or more tetanus toxoid vaccinations during this recent pregnancy were then asked about tetanus toxoid vaccinations they may have previously received. Interviewers also asked women to present their vaccination card on which dates of tetanus toxoid are recorded and referred to information from the cards when available.

Table TM.5.1 shows the protection status from tetanus of women who have had a live birth within the last 2 years.

6.6 DELIVERY CARE

Increasing the proportion of births that are delivered in health facilities is an important factor in reducing the health risks to both the mother and the baby. Proper medical attention and hygienic conditions during delivery can reduce the risks of complications and infection that can cause morbidity and mortality to either the mother or the baby.⁶⁷

Table TM.6.1 presents the percent distribution of women age 15-49 who had a live birth in the two years preceding the survey by place of delivery of the most recent birth, and the percentage of their most recent births delivered in a health facility, according to background characteristics.

About three quarters of all maternal deaths occur due to direct obstetric causes.⁶⁸ The single most critical intervention for safe motherhood is to ensure that a competent health worker with midwifery skills is present at every birth, and, in case of emergency, that there is a referral system in place to provide obstetric care in the right level of facility⁶⁷. The skilled attendant at delivery indicator is used to track progress toward the Sustainable Development Goal 3.1 of reducing maternal mortality and it is SDG indicator 3.1.2.

The MICS included questions to assess the proportion of births attended by a skilled attendant. According to the revised definition, skilled health personnel, as referenced by SDG indicator 3.1.2, are competent maternal and newborn health professionals educated, trained and regulated to national and international standards. They are competent to: facilitate physiological processes during labour to ensure clean and safe birth; and identify and manage or refer women and/or newborns with complications.

Table TM.6.2 presents information on assistance during delivery of the most recent birth in the two years preceding the survey. Table TM.6.2 also shows information on women who delivered by caesarean section (C-section) and provides additional information on the timing of the decision to conduct a C-section (before labour pains began or after) to better assess if such decisions are mostly driven by medical or non-medical reasons.

6.7 BIRTHWEIGHT

Weight at birth is a good indicator not only of a mother's health and nutritional status but also the newborn's chances for survival, growth, long-term health and psychosocial development. Low birth weight (LBW), defined as a birthweight less than 2,500 grams (g) regardless of gestational age, carries a range of grave health and developmental risks for children. LBW babies face a greatly increased risk of dying during their early days with more than 80% of neonatal deaths occurring in LBW newborns; recent evidence also links increased mortality risk through adolescence to LBW. For those who do survive, LBW contributes to a wide range of poor health outcomes including higher risk of stunted linear growth in childhood, and long-term effects into adulthood such as lower IQ and an increased risk of chronic conditions including obesity, diabetes and cardiovascular problems.^{69,70}

Premature birth, being born before 37 weeks gestation, is the primary cause of LBW given that a baby born early has less time to grow and gain weight in utero, especially as much of the foetal weight is gained during the latter part of pregnancy. The other cause of LBW is intrauterine growth restriction which occurs when the foetus does not grow well because of problems with the mother's health and/or nutrition, placental problems, or birth defects. While poor dietary intake and disease during pregnancy can affect birthweight outcome, an intergenerational effect has also been noted with mothers who were themselves LBW having an increased risk of having an LBW offspring.^{71,72,73} Short maternal stature and maternal thinness before pregnancy can increase risk of having an LBW child which can be offset by dietary interventions including micronutrient supplementation.^{74,75} Other factors such as cigarette smoking during pregnancy can increase the risk of LBW, especially among certain age groups.^{76,77}

A major limitation of monitoring LBW globally is the lack of birthweight data for many children, especially in some countries. There is a notable bias among the unweighed, with those born to poorer, less educated, rural mothers being less likely to have a birthweight when compared to their richer, urban counterparts with more highly educated mothers. As the characteristics of the unweighed are related to being LBW, LBW estimates that do not represent these children may be lower than the true value. Furthermore, poor quality of available data with regard to excessive heaping on multiples of 500 g or 100 g exists in the majority of available data

from low and middle-income countries and can further bias LBW estimates.⁷⁸ To help overcome some of these limitations, a method was developed to adjust LBW estimates for missing birth weights and heaping on 2,500 g.⁷⁹ This method comprises a single imputation allowing births with missing birthweights to be included in the LBW estimate using data on maternal perception of size at birth, and also moved 25 per cent of data heaped on 2,500 g to the LBW category. This was applied to available household survey data and the results were reflected in the UNICEF global LBW database between 2004 and 2017. This computation has been used in earlier rounds of MICS reports.

However, the method of estimating LBW has now been replaced with superior modelling. Currently, this new method is not ready for inclusion in the standard tabulations of MICS. Table TM.7.1 therefore presents only the percentage of children weighed at birth and the crude percentage of LBW among children weighed at birth as reported on available cards or from mother's recall. It should be noted that this crude estimate is likely not representative of the full population (typically an underestimate of true LBW prevalence) and therefore must be interpreted with some caution.

¹ MICS indicator TM.11 - Infants weighed at birth

^A The indicator includes children that were reported weighed at birth, but with no actual birthweight recorded or recalled

^B The values here are as recorded on card or as reported by respondent. The total crude low birthweight typically requires adjustment for missing birthweights, as well as heaping, particularly at exactly 2,500 grams. The results presented here cannot be considered to represent the precise rate of low birthweight (very likely an underestimate) and therefore not reported as a MICS indicator.

^C The category of "Vocational" in the background characteristic of "Education" has been suppressed from the table due to a small number of unweighted cases

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

6.8 POST-NATAL CARE

The time of birth and immediately after is a critical window of opportunity to deliver lifesaving interventions for both the mother and newborn. Across the world, approximately 2.6 million newborns annually die in the first month of life⁸⁰ and the majority of these deaths occur within a day or two of birth⁸¹, which is also the time when the majority of maternal deaths occur⁸².

The Post-natal Health Checks module includes information on newborns' and mothers' contact with a provider, and specific questions on content of care. Measuring contact alone is important as Post-natal care (PNC) programmes scale up, it is vital to measure the coverage of that scale up and ensure that the platform for providing essential services is in place.

In Eswatini, post-natal care for mother-baby pair visits is aligned to child immunization schedule and to mother HIV management schedule. The schedule is elaborated in the 2022 Integrated HIV Management Guidelines. Mother-baby pair visit to health facility is according to the following schedule: At 6 weeks, 10 weeks, 14 weeks, 6 months, 9 months, 12 months, 15 months and 18 months.

Table TM.8.1 presents the percent distribution of women age 15-49 who gave birth in a health facility in the two years preceding the survey by duration of stay in the facility following the delivery, according to background characteristics.

Safe motherhood programmes recommend that all women and newborns receive a health check within two days of delivery.⁸³ To assess the extent of post-natal care utilisation, women were asked whether they and their newborn received a health check after the delivery, the timing of the first check, and the type of health provider for the woman's most recent birth in the two years preceding the survey.

Table TM.8.2 shows the percentage of newborns born in the last two years who received health checks and post-natal care visits from any health provider after birth. Please note that *health checks following birth* while in facility or at home refer to checks provided by any health provider regardless of timing (column 1), whereas *post-natal care visits* refer to a separate visit to check on the health of the newborn and provide preventive care services and therefore do not include *health checks following birth* while in facility or at home. The indicator *Post-natal health checks* includes any health check after birth received while in the health facility and at home (column 1), regardless of timing, as well as PNC visits within two days of delivery (columns 2, 3, and 4).

In Table TM.8.3, newborns who received the first PNC visit within one week of birth are distributed by location and type of provider of service. As defined above, a visit does not include a check in the facility or at home following birth.

⁸² WHO et al. *Trends in Maternal Mortality: 1990-2015*. Geneva: WHO Press, 2015.

http://apps.who.int/iris/bitstream/handle/10665/194254/9789241565141_eng.pdf?sequence=1.

⁸³ PNC visits, for mothers and for babies, within two days of delivery, is a WHO recommendation that has been identified as a priority indicator for the Global Strategy for Women's, Children's and Adolescents' Health (2016-2030) and other related global monitoring frameworks like Every Newborn Action Plan and Ending Preventable Maternal Mortality.

Essential components of the content of post-natal care include, but are not limited to, thermal and cord care, breastfeeding counselling, assessing the baby's temperature, weighing the baby and counselling the mother on danger signs for newborns. Thermal care and cord care are essential elements of newborn care which contributes to keeping the baby stable and preventing hypothermia. Appropriate cord care is important for preventing life-threatening infections for both mother and baby.⁸⁴ Table TM.8.4 presents the percentage of last-born children in the last 2 years who were dried after birth, percentage who were given skin to skin contact and percent distribution of timing of first bath. Table TM.8.5 shows the percent distribution of most recent live births in the last 2 years delivered outside a facility by the type of instrument used to cut the umbilical cord and the substance applied to the cord.

Table TM.8.6 presents indicators related to the content of PNC visits, specifically the percent of most recent live births in the last two years for which, within 2 days after birth, i) the umbilical cord was examined, ii) the temperature of the newborn was assessed, iii) breastfeeding counselling was done or breastfeeding observed, iv) the newborn was weighed and v) counselling on danger signs for newborns was done.

Tables TM.8.7 and TM.8.8 present information collected on post-natal health checks and visits of the mother and are identical to Tables TM.8.2 and TM.8.3 that presented the data collected for newborns.

Table TM.8.8 matches Table TM.8.3, but now deals with PNC visits for mothers by location and type of provider. As defined above, a visit does not include a check in the facility or at home following birth.

Table TM.8.9 presents the distribution of women with a live birth in the two years preceding the survey by receipt of health checks or PNC visits within 2 days of birth for the mother and the newborn, thus combining the indicators presented in Tables TM.8.2 and TM.8.7.

⁸⁴ WHO. *WHO recommendations on Postnatal care of the mother and newborn*. Geneva: WHO Press, 2013. http://apps.who.int/iris/bitstream/handle/10665/97603/9789241506649_eng.pdf?sequence=1.

Table TM.8.1: Post-partum stay in health facility

¹ MICS indicator TM.13 - Post-natal health check for the newborn

^A Health checks by any health provider following facility births (before discharge from facility) or following home births (before departure of provider from home).

^B Post-natal care visits (PNC) refer to a separate visit by any health provider to check on the health of the newborn and provide preventive care services. PNC visits do not include health checks following birth while in facility or at home (see note ^A above).

^C Post-natal health checks include any health check performed while in the health facility or at home following birth (see note ^A above), as well as PNC visits (see note ^B above) within two days of delivery.

^D The category of "Vocational" in the background characteristic of "Education" has been suppressed from the table due to a small number of unweighted cases

^E The category of "Other/DK/Missing" in the background characteristic of "Place of delivery" has been suppressed from the table due to a small number of unweighted cases

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

Table TM.8.3: Post-natal care visits for newborns within one week of birth

Percent distribution of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child received a post-natal care (PNC) visit within one week of birth, by location and provider of the first PNC visit, Eswatini MICS, 2021-2022

¹ MICS indicator TM.20 - Post-natal health check for the mother

² Country specific indicator TM.S4 - Provision of care-seeking information for mother

^A Health checks by any health provider following facility births (before discharge from facility) or following home births (before departure of provider from home).

^B Post-natal care visits (PNC) refer to a separate visit by any health provider to check on the health of the mother and provide preventive care services. PNC visits do not include health checks following birth while in facility or at home (see note ^A above).

^C Post-natal health checks include any health check performed while in the health facility or at home following birth (see note ^A above), as well as PNC visits (see note ^B above) within two days of delivery.

^D The category of "Vocational" in the background characteristic of "Education" has been suppressed from the table due to a small number of unweighted cases

^E The category of "Other/DK/Missing" in the background characteristic of "Place of delivery" has been suppressed from the table due to a small number of unweighted cases

6.9 SEXUAL BEHAVIOUR

Promoting safer sexual behaviour is critical for reducing the risk of HIV transmission. The consistent use of condoms during sex, especially when non-regular or multiple partners are involved, is particularly important for reducing the spread of HIV.^{85,86} A set of questions was administered to all women and men 15-49 years of age to assess their risk of HIV infection. Tables TM.10.1W and TM.10.1M present the percentage of women and men age 15-49 years who ever had sex, percentage who had sex in the last 12 months, percentage who had sex with more than one partner in the last 12 months, and among those who had sex with multiple partners in the last 12 months, the percentage who used a condom at last sex.

Certain behaviour at a young age may create, increase, or perpetuate risk of exposure to HIV. Such behaviour includes sex at an early age and women having sex with older men⁸⁵. Tables TM.10.2W and 10.2M show the percentage of women and men age 15-24 years for such key sexual behaviour indicators.

6.10 HIV

Some of the most important prerequisites for reducing the rate of HIV infection is accurate knowledge of how HIV is transmitted and strategies for preventing transmission⁸⁶. Correct information is the first step towards raising awareness and giving adolescents and young people the tools to protect themselves from infection. Misconceptions about HIV are common and can confuse adolescents and young people and hinder prevention efforts^{85,86}. The UN General Assembly Special Session on HIV/AIDS (UNGASS) called on governments to improve the knowledge and skills of young people to protect themselves from HIV^{85,86}. The HIV module administered to women and men 15-49 years of age addresses part of this call.

The Global AIDS Monitoring (GAM) Reporting indicator: the percentage of young people who have comprehensive and correct knowledge of HIV prevention and transmission is defined as 1) knowing that consistent use of a condom during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV. 2) knowing that a healthy-looking person can have HIV. and 3) rejecting the two most common local misconceptions about transmission/prevention of HIV. In the Eswatini MICS, 2021-2022 all women and men who have heard of AIDS were asked questions on all three components and the results are detailed in Tables TM.11.1W and TM.11.1M.

Tables TM.11.1W and TM.11.1M also present the percentage of women and men who can correctly identify misconceptions concerning HIV. The indicator is based on the two most common and relevant misconceptions in Eswatini, that HIV can be transmitted by mosquito bites or supernatural means. The tables also provide information on whether women and men know that HIV cannot be transmitted by sharing food with someone with HIV.

Knowledge of mother-to-child transmission of HIV is also an important first step for women to seek HIV testing when they are pregnant to avoid infection in the baby. Women and men should know that HIV can be transmitted during pregnancy. during delivery. and through breastfeeding. The level of knowledge among women and men age 15-49 years concerning mother-to-child transmission is presented in Tables TM.11.2W and TM.11.2M.

Discrimination is a human rights violation prohibited by international human rights law and most national constitutions. Discrimination in the context of HIV refers to unfair or unjust treatment (an act or an omission) of an individual based on his or her real or perceived HIV status. Discrimination exacerbates risks and deprives people of their rights and entitlements. fuelling the HIV epidemic⁸⁶.

The following questions were asked in Eswatini MICS, 2021-2022 to measure stigma and discriminatory attitudes that may result in discriminatory acts (or omissions): whether the respondent 1) would buy fresh vegetables from a shopkeeper or vendor who has HIV; 2) thinks that children living with HIV should be allowed to attend school with children who do not have HIV; 3) thinks people hesitate to take an HIV test because they are afraid of how other people will react if the test result is positive for HIV; 4) thinks people talk badly about those living with HIV. or who are thought to be living with HIV; 5) thinks people living with HIV. or thought to be living with HIV. lose the respect of other people; 6) agrees or disagrees with the statement 'I would be ashamed if someone in my family had HIV'; and 7) fears that she/he could get HIV if she/he comes into contact with the saliva of a person living with HIV. Tables TM.11.3W and TM.11.3M present the attitudes of women and men towards people living with HIV.

Another important indicator is the knowledge of where to be tested for HIV and use of such services. In order to protect themselves and to prevent infecting others, it is important for individuals to know their HIV status. Knowledge of own status is also a critical factor in the decision to seek treatment^{85,86}. Questions related to knowledge of a facility for HIV testing and whether a person has ever been tested are presented in Tables TM.11.4W and TM.11.4M.

Among women who had given birth within the two years preceding the survey, the percentage who received counselling and HIV testing during antenatal care is presented in Table TM.11.5. This indicator is used to track progress towards global and national goals to eliminate mother-to-child transmission of HIV. High coverage enables early initiation of care and treatment for HIV positive mothers required to live healthy and productive lives

In many countries, over half of new adult HIV infections are among young people age 15-24 years thus a change in behaviour among members of this age group is especially important to reduce new infections^{85,86}. The next tables present specific information on this age group. Tables TM.11.6W and TM.11.6M summarise information on key HIV indicators for young women and young men.

Table TM.11.1W: Knowledge about HIV transmission, misconceptions about HIV, and comprehensive knowledge about HIV transmission (women)

Percentage of women age 15-49 years who know the main ways of preventing HIV transmission, percentage who know that a healthy-looking person can be HIV-positive, percentage who reject common misconceptions, and percentage who have comprehensive knowledge about HIV transmission, Eswatini MICS, 2021-2022

	Percentage who know transmission can be prevented by:				Percentage who know that a healthy-looking person can be HIV-positive	Percentage who know that HIV cannot be transmitted by:			Percentage who reject the two most common misconceptions and know that a healthy-looking person can be HIV-positive	Percentage with comprehensive knowledge ^{1,A}	Number of women
	Percentage who have heard of AIDS	Having only one faithful uninfected sex partner	Using a condom every time	Both		Mosquito bites	Supernatural means	Sharing food with someone with HIV

6.11 MALE CIRCUMCISION

Evidence has shown that male circumcision (the complete removal of the foreskin of the penis) reduces the risk of heterosexually acquired HIV infection in men by approximately 60 percent and is safe when performed by well-trained health professionals in properly equipped settings.⁸⁷ In countries and regions with heterosexual epidemics and high HIV and low male circumcision prevalence, male circumcision is being included in comprehensive HIV prevention packages⁸⁶. Alone, male circumcision is only partially protective, however, when combined with HIV testing and counselling services, condoms, safer sexual practices and treatment of sexually transmitted infections, it is highly effective^{85,86}. It may already be performed for religious, medical, or cultural reasons and can be carried out at birth, during adolescence, or at other times during a man's life.

Male circumcision is one of the HIV prevention strategies in Eswatini and the Male Circumcision Policy as developed in 2019. Men in Eswatini do not perform male circumcision for traditional purposes, as such the Ministry of Health has put more effort in increasing demand for male circumcision through advocacy campaigns for men 10-49 years. This age group was primarily targeted as evidence has shown that scale up of Voluntary Medical Male Circumcision (VMMC) would be more effective if it reached 80 percent of the targeted male population. Eswatini has increased the number of skilled health care providers that can perform the service and ensuring that high quality service delivery sites are easily accessible by all members of society. Promoting VMMC through multiple communication strategies such as engaging communities through community sports events and engaging young men and women in schools through health promotion presentations within the schools are amongst many of the innovative strategies the Ministry of Health has used to increase the number of VMMCs occurring in Eswatini. All VMMC services that are promoted in the country are performed free of charge within the multiple service delivery points within the country

The prevalence of male circumcision is presented in Table TM.12.1. which also shows the age of circumcision while Table TM.12.2 shows the provider and place where circumcision was performed.

⁸⁷ Bailey, R. et al. "Male Circumcision for HIV Prevention in Young Men in Kisumu, Kenya: A Randomised Controlled Trial." *The Lancet* 369, no. 9562 (2007): 643-56. doi:10.1016/S0140-6736(07)60312-2.

6.12 COVID-19, NON-COMMUNICABLE DISEASE AND MENTAL HEALTH

COVID-19 is a disease caused by coronavirus and it affects both humans and animals. In humans, the disease leads to respiratory infections ranging from the common cold to more severe diseases such as Middle East Respiratory Syndrome (MERS) and severe acute respiratory syndrome (SARS). In March 2020, the World Health Organisation (WHO) declared the outbreak a global pandemic and recommended that all countries scale up surveillance and prepare for a threat of COVID-19. Eswatini reported its first confirmed case on 14 March, 2020 and recognized the serious threat that the (COVID-19) global outbreak posed to the country. In response, a COVID-19 Response strategy was put in place. One of the strategic focus was to strengthen risk communication and community engagement activities, engaging media for accurate information dissemination including through community-based communication, mass media and social media. In Eswatini MICS, 2021-2022, women and men aged 15-49 years, who reported being informed about COVID-19 were asked questions on all three ways of preventing its spread, popular misconceptions regarding the prevention or treatment and reporting that they would be afraid with associating with a survivor of COVID-19. Table TM.13.CS1W and TM.13.CS1M presents results on knowledge about COVID-19 for women and men respectively.

Non-communicable diseases comprise many conditions which are classified as those attributed to lifestyle such as diabetes mellitus, hypertension, cardiovascular diseases, malignancies, Chronic Obstructive Pulmonary diseases all of which share common risk factors namely dietary intake, physical activity, harmful use of alcohol and tobacco use. These are the core mandate of the Eswatini Non-Communicable Disease' Program in the Ministry of Health. Other NCDs include epilepsy, injuries, mental health, eye and ear health amongst others. In Eswatini, the NCD programme uses an integrated approach in collaboration with other government departments and use the life cycle approach. Tables TM.13.CS2W and TM.13.CSM presents the prevalence of key non-communicable disease, medical treatment and screening for cancer among women and men respectively.

Mental health includes our emotional, psychological, and social well-being. It affects how we think, feel, and act. It also helps determine how we handle stress, relate to others, and make healthy choices. Mental health is important at every stage of life, from childhood and adolescence through adulthood. Eswatini MICS, 2021-2022, women and men age 15-49 years were asked if they ever attempted suicide, considered to attempt suicide in the past year and whether close family member died of suicide. The results are presented in TM.13.CS3W and TM.13.CS3M for women and men, respectively.

Table TM.13.CS1W: Knowledge about COVID-19 (women)

Percentage of women age 15-49 years who reported being informed about Covid-19, percentage who know all three ways of preventing the spread of COVID-19, percentage who correctly identify the three popular misconceptions regarding the prevention or treatment of COVID-19, percentage reporting that they would be afraid of associating with a survivor of COVID-19, and percentage who could not receive medical treatment when needed during COVID-19 restrictions, Eswatini MICS, 2021-2022

7.1 IMMUNISATION

Immunisation is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert between 2 and 3 million deaths each year.⁸⁸ It is one of the most cost-effective health investments, with proven strategies that make it accessible to even the most hard-to-reach and vulnerable populations.

The WHO Recommended Routine Immunisations for Children⁸⁹ recommends all children to be vaccinated against tuberculosis, diphtheria, tetanus, pertussis, polio, measles, hepatitis B, haemophilus influenzae type b, pneumococcal bacteria/disease, rotavirus, and rubella.⁹⁰

At the global level, SDG indicator 3.b.1 is used to monitor the progress of the vaccination of children at the national level. The proportions of the target population covered by DTP, pneumococcal (conjugate) and measles are presented in Table TC.1.1.

All doses in the primary series are recommended to be completed before the child's first birthday, although depending on the epidemiology of disease in a country, the first doses of measles and rubella containing vaccines may be recommended at 12 months or later. The recommended number and timing of most other doses also vary slightly with local epidemiology and may include booster doses later in childhood.

	Eswatini Childhood Immunization Schedule								
	BCG	OPV	DTP_HepB-Hib	PCV13	Rotarix	IPV	MR1	MR2	DPT
At Birth	✓	✓							
6 weeks		✓	✓	✓					
10 weeks		✓	✓	✓	✓				
14 weeks		✓	✓	✓	✓	✓			
9 months							✓		
18 months		✓						✓	✓

The vaccination schedule followed by the Eswatini Expanded Programme on Immunization (EPI) provides all the above mentioned vaccinations with birth doses of BCG and oral polio vaccine (within 24 hours of birth), three doses of the Pentavalent vaccine containing DTP, Hepatitis B, and Haemophilus influenzae type b (Hib) antigens, four doses of oral polio vaccine, one dose of inactivated polio vaccine, three doses of pneumococcal (conjugate) vaccine, two doses of rotavirus vaccine, two doses of the MR vaccine containing measles and rubella antigens and one DPT booster.

⁸⁸ "Immunization Highlights 2015." World Health Organization. June 27, 2016. Accessed August 23, 2018.

<http://www.who.int/immunization/highlights/2015/en/>.

⁸⁹ "WHO Recommendations for Routine Immunization - Summary Tables." World Health Organization. August 22, 2018. Accessed August 23, 2018. http://www.who.int/immunization/policy/immunization_tables/en/.

⁹⁰ Additionally, vaccination against the human papillomavirus (HPV) is recommended for girls from 9 to 14 years of age⁸⁹, but coverage of this vaccine is not yet included in MICS, as methodology is under development.

All vaccinations should be received during the first year of life except the second dose of MR, the DPT booster and OPV4 at 18 months. Taking into consideration this vaccination schedule, the estimates for full vaccination coverage from the Eswatini MICS, 2021-2022 are based on children age 24-35 months. However, since the DPT booster was introduced in May 2019, according to the Ministry of Health, it is not included in the definition of all antigens.

Information on vaccination coverage was collected for all children under three years of age. All mothers or caretakers were asked to provide vaccination cards. If the vaccination card for a child was available, interviewers copied vaccination information from the cards onto the MICS questionnaire. If no vaccination card was available for the child, the interviewer proceeded to ask the mother to recall whether the child had received each of the vaccinations, and, for applicable antigens, how many doses were received. The final vaccination coverage estimates are based on information obtained from the vaccination card and the mother's report of vaccinations received by the child.

Table TC.1.2 presents vaccination coverage estimates among children age 12-23 and 24-35 months by background characteristics. The figures indicate children receiving the vaccinations at any time up to the date of the survey and are based on information from both the vaccination cards and mothers'/caretakers' reports.

Table TC.1.1: Vaccinations in the first years of life

Percentage of children age 12-23 months and 24-35 months vaccinated against vaccine preventable childhood diseases at any time before the survey (Crude coverage) and by their first birthday, Eswatini MICS, 2021-2022

Antigen	Children age 12-23 months:				Children age 24-35 months:			Vaccinated by 12 months of age (MCV2, OPV4 and, DPT Booster 1 by 24 months)

7.2 DISEASE EPISODES

A key strategy for achieving progress toward SDG 3.2: By 2030, end preventable deaths of newborns and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1,000 live births and under-5 mortality to at least as low as 25 per 1,000 live births, is to tackle the diseases such as diarrhoea, pneumonia and malaria which are still among the leading killers of children under 5.⁹¹ Target 3.3 of the SDGs on ending the epidemics on malaria by 2030 along with other diseases is interpreted as the attainment of the Global Technical Strategy for malaria 2016–2030 and the Roll Back Malaria advocacy plan, Action and Investment to defeat Malaria 2016–2030 targets which aim at reducing malaria mortality rates globally by 90 percent compared with 2015.

Table TC.2.1 presents the percentage of children under 5 years of age who were reported to have had an episode of diarrhoea, symptoms of acute respiratory infection (ARI) or fever during the 2 weeks preceding the survey. These results are not measures of true prevalence, and should not be used as such, but rather the period-prevalence of those illnesses over a two-week time window.

The definition of a case of diarrhoea or fever, in this survey, was the mother's (or caretaker's) report that the child had such symptoms over the specified period; no other evidence was sought beside the opinion of the mother. A child was considered to have had symptoms of ARI if the mother or caretaker reported that the child had, over the specified period, an illness with a cough with rapid or difficult breathing, and whose symptoms were perceived to be due to a problem in the chest or both a problem in the chest and a blocked or runny nose. While this approach is reasonable in the context of a multi-topic household survey, these basically simple case definitions must be kept in mind when interpreting the results, as well as the potential for reporting and recall biases. Further, diarrhoea, fever and ARI are not only seasonal but are also characterized by the often rapid spread of localized outbreaks from one area to another at different points in time. The timing of the survey and the location of the teams might thus considerably affect the results, which must consequently be interpreted with caution. For these reasons, although the period-prevalence over a two-week time window is reported, these data should not be used to assess the epidemiological characteristics of these diseases but rather to obtain denominators for the indicators related to use of health services and treatment.

⁹¹ The main killers of children under age 5 in 2016 included preterm birth complications (18 per cent), pneumonia (16 per cent), intrapartum related events (12 per cent), diarrhoea (8 per cent), neonatal sepsis (7 per cent) and malaria (5 per cent). UNICEF et al. *Levels and Trends in Child Mortality Report 2017*. New York: UNICEF, 2017. https://www.unicef.org/publications/index_101071.html.

7.3 DIARRHOEA

Diarrhoea is one of the leading causes of death among children under five worldwide.⁹² Most diarrhoea-related deaths in children are due to dehydration from loss of large quantities of water and electrolytes from the body in liquid stools. Management of diarrhoea – either through oral rehydration salt solution (ORS) or a recommended homemade fluid (RHF) – can prevent many of these deaths.⁹³ In addition, provision of zinc supplements has been shown to reduce the duration and severity of the illness as well as the risk of future episodes within the next two or three months.

Almost 60 per cent of deaths due to diarrhoea worldwide are attributable to unsafe drinking water and poor hygiene and sanitation. Hand washing with soap alone can cut the risk of diarrhoea by at least 40 per cent and significantly lower the risk of respiratory infections. Clean home environments and good hygiene are important for preventing the spread of both pneumonia and diarrhoea, and safe drinking water and proper disposal of human waste, including child faeces, are vital to stopping the spread of diarrhoeal disease among children and adults⁸⁹.

In the MICS, mothers or caretakers were asked whether their child under age five years had an episode of diarrhoea in the two weeks prior to the survey. In cases where mothers reported that the child had diarrhoea, a series of questions were asked about the treatment of the illness, including what the child had been given to drink and eat during the episode and whether this was more or less than what was usually given to the child.

Table TC.3.1 shows the percentage of children age 0-59 months with diarrhoea in the two weeks preceding the survey for whom advice or treatment was sought and from where.

Table TC.3.2 shows patterns on drinking and feeding practices during diarrhoea among children age 0-59 months.

Table TC.3.3 shows the percentage of children age 0-59 months receiving ORS, various types of recommended homemade fluids and zinc during the episode of diarrhoea. Since children may have been given more than one type of liquid, the percentages do not necessarily add to 100.

Table TC3.4 provides the proportion of children age 0-59 months with diarrhoea in the last two weeks who received oral rehydration therapy with continued feeding, and the percentage of children with diarrhoea who received other treatments.

Table TC.3.5 provides information on the source of ORS and zinc for children age 0-59 months who received these treatments.

¹ MICS indicator TC.12 - Care-seeking for diarrhoea

^A Community health providers includes both public (Community health worker and Mobile/Outreach clinic) and private (Non-Government community health worker and Mobile clinic) health facilities

^B Includes all public and private health facilities and providers, as well as those who did not know if public or private. Excludes private pharmacy

^C The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

^A Community health providers includes both public (Community health worker and Mobile/Outreach clinic) and private (Non-Government community health worker and Mobile clinic) health facilities

^B Includes all public and private health facilities and providers, as well as those who did not know if public or private

^C The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

(*) Figures that are based on fewer than 25 unweighted cases

7.4 HOUSEHOLD ENERGY USE

There is a global consensus and an ever-growing body of evidence that expanding access to clean household energy for cooking, heating, and lighting is key to achieving a range of global priorities such as improving health, gender equality, equitable economic development and environmental protection. Goal 7 of the Sustainable Development Goals seeks to ensure access to affordable, reliable sustainable and modern energy for all by 2030 and would be measured as the percentage of the population relying on clean fuels and technology.⁹⁴

The Eswatini MICS, 2021-2022 MICS included a module with questions to assess the main technologies and fuels used for cooking, heating, and lighting. Information was also collected about the use of technologies with chimneys or other venting mechanisms which can improve indoor air quality through moving a fraction of the pollutants outdoors.

Households that use clean fuels and technologies for cooking are those mainly using electric stove, solar cooker, LPG (Liquefied Petroleum Gas)/cooking gas stove, biogas stove, or a liquid fuel stove burning ethanol/alcohol only. Table TC.4.1 presents the percent distribution of household members according to type of cookstove mainly used by the household and percentage of household members living in households using clean fuels and technologies for cooking.

Table TC.4.2 further presents the percent distribution of household members using polluting fuels and technologies for cooking according to type of cooking fuel mainly used by the household, and percentage of household members living in households using polluting fuels and technologies for cooking while Table TC.4.3 presents the percent distribution of household members in households using polluted fuels for cooking by type and characteristics of cookstove and by place of cooking.

Households that use clean fuels and technologies for space heating are those mainly relying on central heating or using solar air heater, electricity, piped natural gas, LPG/cooking gas, biogas, or alcohol/ethanol. Table TC.4.4 presents the percent distribution of household members according to type of fuel mainly used for space heating by the household, and percentage of household members living in households using clean fuels and technologies for space heating. Table TC.4.5 presents the percent distribution of household members by the type of space heating mainly used in the household and presence of chimney.

Households that use clean fuels and technologies for lighting are those mainly using electricity, solar lantern, rechargeable or battery powered flashlight, torch or lantern, or biogas lamp. Table TC.4.6 presents the percent distribution of household members according to type of lighting fuel mainly used for lighting by the household, and percentage of household members living in households using clean fuels and technologies for lighting.

The questions asked about cooking, space heating and lighting help to monitor SDG indicator 7.1.2, “Proportion of population with primary reliance on clean fuels and technology” for cooking, space heating and lighting. Table TC.4.7 presents the percentage of household members living in households using clean fuels and technologies for cooking, space heating, and lighting.

7.5 MALARIA

Table TC.6.10 presents the percentage of children under age five with fever in the last two weeks for whom advice or treatment was sought by source of advice or treatment. Table TC.6.11 provide further insight on treatment of children with fever.

Mothers were also asked to report all of the medicines given to a child to treat the fever, including both medicines given at home and medicines given or prescribed at a health facility. Artemisinin-based Combination therapy (ACT) is the recommended first line antimalarial recommended by the World Health Organization and use in Eswatini. In addition, confirmation of malaria is done on all fever cases through rapid diagnostic test. Treatment-related findings are presented in tables TC.6.11-12.

Table TC.6.10: Care-seeking during fever

Percentage of children age 0-59 months with fever in the last two weeks for whom advice or treatment was sought, by source of advice or treatment, Eswatini MICS, 2021-2022

7.6 INFANT AND YOUNG CHILD FEEDING

Optimal infant and young child feeding practices can increase survival and promote healthy growth and development, particularly during the critical window from birth to 2 years of age.

Breastfeeding in the first few years of life protects children from infection, provides an ideal source of nutrients and is economical and safe.⁹⁵ Despite these critical benefits, breastfeeding practices are suboptimal in many parts of the world. Many children do not start breastfeeding early enough, do not breastfeed exclusively for the recommended six months or stop breastfeeding too soon.⁹⁶ Mothers often face pressures to switch to infant formula, which can contribute to growth faltering and micronutrient malnutrition. Infant formula and other breastmilk substitutes can also be life-threatening in settings where hygienic conditions and safe drinking water are not readily available. In some cases, it can be unsafe even with proper and hygienic preparation in the home due to food adulteration or other contamination that can affect unaware consumers.⁹⁷ As children reach the age of 6 months, their consumption of appropriate, adequate and safe complementary foods and continued breastfeeding leads to better health and growth outcomes, with the potential to reduce stunting during the first two years of life.⁹⁸

UNICEF and WHO recommend that infants be: (i) breastfed within one hour of birth; (ii) breastfed exclusively for the first six months of life; and (iii) breastfed for up to 2 years of age and beyond.⁹⁹ Starting at 6 months, breastfeeding should be combined with safe, age-appropriate feeding of solid, semi-solid and soft foods with specific guiding principles available about how the feeding should be done with topics ranging from food consistency to responsive feeding.^{100,101} The breastfeeding recommendations and guiding principles for complementary feeding for which standard indicators^{102,103} have been developed, and which are collected in this survey, are listed in the table below.

Recommendation/ guiding principle	Indicators /proximate measures ¹⁰⁴	Notes on interpretation ¹⁰⁵	Table
Breastfeed within one hour of birth	Early Initiation of breastfeeding Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	This is the only indicator in the series based on historical recall, that is, of what happened up to 2 years before the survey interview.	TC.7.1
Breastfeed exclusively for the first six months of life	Exclusive breastfeeding under 6 months Percentage of infants under 6 months of age who are exclusively breastfed ¹⁰⁶	Captures the desired practice for the entire population of interest (i.e., all children age 0-5 months should be exclusively breastfed) in a 24-hour period. It does not represent the proportion of infants who are exclusively breastfed every day from birth until they are 6 months of age and should not be interpreted as such.	TC.7.3
Introduce solid, semi-solid and soft foods at the age of 6 months	Introduction of solid, semi-solid or soft foods (age 6-8 months) Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	Captures the desired practice for the entire population of interest (i.e., all children age 6-8 months should eat solids) in a 24-hour period. It does not represent the proportion of infants who began receiving solids when they turned 6 months nor the proportion of children age 6-8 months who received solids every day since they turned 6 months of age and should not be interpreted as such.	TC.7.6
Continue frequent, on-demand breastfeeding for two years and beyond	Continued breastfeeding at 1 year and 2 years Percentage of children age 12-15 months (1 year) and 20-23 months (2 years) who received breast milk during the previous day	Captures the desired practice for different populations of interest (children should be breastfed for up to 2 years) in a 24-hour period. However, the label of 1 and 2 years can be confusing given the actual age range in months for each indicator.	TC.7.3
Provide meals with appropriate frequency and energy density	Minimum meal frequency (age 6–23 months) <u>Breastfed children:</u> Depending on age, at least two or three meals/snacks provided during the previous day <u>Non-breastfed children:</u> At least four meals/snacks <u>and/or milk feeds</u> provided during the previous day	This indicator represents the minimum number of meals and not adequacy. In addition, standard questionnaires do not distinguish if milk feeds were provided as part of a solid meal or as a separate meal. Meals may therefore be double counted for some non-breastfed children. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide foods with appropriate nutrient content	Minimum dietary diversity (age 6–23 months) At least five of eight food groups ¹⁰⁷ consumed in the 24 hours preceding the survey	This indicator represents the minimum dietary diversity and not adequacy. In addition, consumption of any amount of food from each food group is sufficient to "count" as the standard indicator is only meant to capture yes/no responses. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide an appropriate amount of food	No standard indicator exists		na
Provide food with appropriate consistency	No standard indicator exists		na
Use of vitamin-mineral supplements or fortified products	No standard indicator exists		na
Safe preparation and storage of foods	While it was not possible to develop indicators to fully capture guidance, one indicator does cover part of the principle: Not feeding with a bottle with a nipple		TC.7.8
Responsive feeding	No standard indicator exists		na

In addition to the indicators in the table above, three dimensions of complementary feeding are combined to form a composite indicator of "minimum acceptable diet". This indicator assesses

¹⁰⁴ It should be noted that these indicators are, in general, proximate measures which do not capture the exact recommendations or guidelines, but serve as a basis for monitoring, providing useful information on the population of interest.

¹⁰⁵ For all indicators other than early initiation of breastfeeding, the definition is based on current status, that is, what happened during the day before the survey from the time when the child woke up to the time when he/she went to sleep until the morning of the day of the interview.

¹⁰⁶ Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines.

¹⁰⁷ The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) Breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

energy needs and nutrient adequacy (apart from iron). To have a minimum acceptable diet, a child must have received in the previous day:

- (i) The appropriate number of meals/snacks/milk feeds;
- (ii) Food items from at least 5 out of 8 food groups for breastfed children; and 4 out of 7¹⁰⁸ food groups for non-breastfed children; and
- (iii) At least two milk feeds for non-breastfed children.

Table TC.7.1 is based on mothers' reports of when their last-born child, born in the last two years, was first put to the breast. It indicates the proportion who were ever breastfed, as well as those who were first breastfed within one hour and one day of birth.

Table TC.7.2 presents information about liquids or other items newborns were given in the first 3 days of life, apart from breastmilk. The data are disaggregated by various background characteristics, including whether the child was ever breastfed or not.

The set of infant and young child feeding indicators reported in tables TC.7.3 through TC.7.6 are based on the mother's report of consumption of food and liquids during the day or night prior to being interviewed. Data are subject to a number of limitations, some related to the respondent's ability to provide a full report on the child's liquid and food intake due to recall errors, as well as lack of knowledge in cases where the child was fed by other individuals.

In Table TC.7.3, breastfeeding status is presented for *exclusively breastfed* infants age 0–5 months (i.e. those who receive only breastmilk) and *predominantly* breastfed infants age 0–5 months (i.e. those who receive breastmilk in addition to plain water and/or non-milk liquids). The table also shows continued breastfeeding of children age 12–15 months and age 20–23 months.

Table TC.7.4 shows the median duration of any breastfeeding among children age 0–35 months and the median duration of exclusive breastfeeding and predominant breastfeeding among children age 0–23 months.

The age-appropriateness of breastfeeding practices for children under the age of 24 months is provided in Table TC.7.5. Different feeding criteria are used depending on the age of the child. For infants age 0–5 months, exclusive breastfeeding is considered age-appropriate feeding, while children age 6–23 months are considered appropriately fed if they are receiving breastmilk and solid, semi-solid or soft foods.

Table TC.7.6 further looks into the introduction of solid, semi-solid, or soft foods for infants age 6–8 months, while Table TC.7.7 presents the percentage of children age 6–23 months who received the minimum number and diversity of meals/snacks during the previous day (referring to solid, semi-solid, or soft food, but also milk feeds for non-breastfed children), by breastfeeding status.

The continued practice of bottle-feeding is a concern because of the potential for contamination if the bottle and/or nipple are not properly cleaned or sterilized. Bottle-feeding can also hinder breastfeeding due to nipple confusion, especially at the youngest ages.¹⁰⁹ Table TC.7.8 presents the

¹⁰⁸ Note that the denominator becomes 7 food groups for non-breastfed children in the composite indicator as the milk products group is removed from diet diversity, as this is assessed separately.

¹⁰⁹ Zimmerman, E. and K. Thompson. "Clarifying Nipple confusion." *J Perinatol* 35, no.11 (2015):895-9. doi: 10.1038/jp.2015.83.

percentage of children aged 0–23 months who were bottle-fed with a nipple during the previous day.

¹ MICS indicator TC.39a - Minimum acceptable diet (breastfed children)

² MICS indicator TC.S6b - Minimum acceptable diet (non-breastfed children)

³ MICS indicator TC.40 (IYCF 2021 2.4) - Milk feeding frequency for non-breastfed children

⁴ MICS indicator TC.41 (IYCF 2021 2.2) - Minimum dietary diversity

⁵ MICS indicator TC.S7 (IYCF 2021 2.3) - Minimum meal frequency

⁶ MICS indicator TC.S8 (IYCF 2021 2.5) - Minimum acceptable diet (6-23 months)

^A Minimum dietary diversity is defined as receiving foods from at least 5 of 8 food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

^B Minimum meal frequency among currently breastfeeding children is defined as children who also received solid, semi-solid, or soft foods 2 times or more daily for children age 6-8 months and 3 times or more daily for children age 9-23 months. For non-breastfeeding children age 6-23 months it is defined as receiving solid, semi-solid or soft foods, or milk feeds, at least 4 times.

^C The minimum acceptable diet for breastfed children age 6-23 months is defined as receiving the minimum dietary diversity and the minimum meal frequency, while it for non-breastfed children further requires at least 2 milk feedings.

^D The categories "Vocational" and "Missing/DK" of the background characteristics "Mother's education" have been suppressed due to a small unweighted denominators

^E The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

7.7 MALNUTRITION

Children's nutritional status reflects their overall health. When children have access to an adequate food supply, are not exposed to repeated illness, and are well cared for, they reach their growth potential and are considered well-nourished.

Undernutrition is associated with nearly half of all child deaths worldwide.¹¹⁰ Children suffering from undernutrition are more likely to die from common childhood ailments, and those who survive often suffer recurring sicknesses and faltering growth. Three-quarters of children who die from causes related to undernutrition only had mild or moderate forms of undernutrition, meaning they showed little outward sign of their vulnerability.¹¹¹ The Sustainable Development Goal target 2.2 is to reduce the prevalence of stunting among children under five by 40 per cent between 2012 and 2025 as well as to reduce wasting to <5 per cent and have no increase in overweight over the same period. A reduction in the prevalence of malnutrition will also contribute to the achievement of several other global goals, including the goal to end preventable newborn and child deaths.

In a well-nourished population, there is a reference distribution of height and weight for how children under 5 should grow. The reference population used in this report is based on the WHO growth standards.¹¹² Undernutrition in a population can be gauged by comparing children to this reference population. Each of the three nutritional status indicators – weight-for-age, height-for-age, and weight-for-height – can be expressed in standard deviation units (z-scores) from the median of the reference population.

Weight-for-age is a measure of both acute and chronic malnutrition. Children whose weight-for-age is more than two standard deviations below the median of the reference population are considered *moderately or severely underweight*, while those whose weight-for-age is more than three standard deviations below the median are classified as *severely underweight*.

Height-for-age is a measure of linear growth. Children whose height-for-age is more than two standard deviations below the median of the reference population are considered short for their age and are classified as *moderately or severely stunted*. Those whose height-for-age is more than three standard deviations below the median are classified as *severely stunted*. Stunting, or chronic malnutrition, is the result of failure to receive adequate nutrition in early life over an extended period and/or recurrent or chronic illness.

Weight-for-height can be used to assess wasting and overweight status. Children whose *weight-for-height* is more than two standard deviations below the median of the reference population are classified as *moderately or severely wasted*, while those who fall more than three standard deviations below the median are classified as *severely wasted*. Wasting is usually the result of poor nutrient intake or disease. The prevalence of wasting may shift seasonally in response to changes in the availability of food and/or disease prevalence.

¹¹² WHO. *Child Growth Standards*. Technical Report, Geneva: WHO Press, 2006. http://www.who.int/childgrowth/standards/Technical_report.pdf?ua=1

Children whose weight-for-height is more than two standard deviations above the median reference population are classified as moderately or severely overweight.

In MICS, weights and heights of all children under 5 years of age were measured using the anthropometric equipment recommended by UNICEF.¹¹³

Prior to the fieldwork, UNICEF and CSO collaborated on testing a recently developed digital length/height measurement board. The board was essentially similar in design to the traditional wooden portable baby/infant length-height measuring board supplied by UNICEF, but with the added feature of indicating the measurement result on a screen (similar to that of the digital scale) and the ability to transfer the measurement to the CAPI Application via Bluetooth. It was agreed that the outcome of the test would determine whether the digital board would be used in the survey with the simple benchmark of performing at least as good as the traditional board. Due to logistical and practical challenges imposed by necessary COVID-19 protocols and international travel restrictions, the testing was reduced in size and scope. However, the results still presented small but statistically significant improvements to measurement precision comparing the digital board to the traditional board. The measurers also indicated their preference for working with the digital board. Based on this, field teams performed measurements on the digital board during fieldwork, but also brought an additional digital board along in case of equipment issues and the survey team retained traditional boards for back-up in the central office. Testing had revealed some problems with device durability, and these did present during fieldwork, mainly relating to battery charging and Bluetooth connection issues. The affected teams could however continue work using the additional digital board and did not need to employ any traditional boards.

Findings in this section are based on the results of these measurements in conjunction with the age in months data based on birth dates collected during the survey interview. After further improvements to the digital device by the manufacturer, UNICEF expects that the Eswatini experience will allow the new digital board to become integrated into most MICS surveys across the world and offered through the UNICEF Supply Catalogue.

Table TC.8.1 shows percentages of children classified into each of the above-described categories, based on the anthropometric measurements that were taken during fieldwork. Additionally, the table includes mean z-scores for all three anthropometric indicators.

Children whose full birth date (month and year) were not obtained, and children whose measurements were not taken due to absence from the home during interviews or other reasons, or whose measurements are outside a plausible range are excluded from Table TC.8.1. Children are excluded from one or more of the anthropometric indicators when their weights and heights have not been measured, or their age is not available, whichever applicable. For example, if a child has been weighed but his/her height has not been measured, the child is included in underweight calculations, but not in the calculations for stunting and wasting. Percentages of children by age and reasons for exclusion are shown in the data quality tables DQ.3.4, DQ.3.5, and DQ.3.6 in Appendix D. The tables show that due to incomplete dates of birth, implausible measurements, and/or missing weight and/or height, 3.6% percent of children have been excluded from calculations of the weight-for-age indicator, 3.3% percent from the height-for-age indicator, and 2.9% percent for the weight-for-height indicator. There are no observed data quality issues that affect anthropometric indicators, such as heaping on age, out-transference or digit preference in measurements. However, noting a

¹¹³ See MICS Supply Procurement Instructions: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#survey-design>.

relatively high proportion of children under 6 months excluded from analysis (8.4% for weight-for-height, 8.5% for height-for-age and 7.6% for weight-for-age), estimates for this age group should be used with precaution.

7.8 SALT IODISATION

Iodine Deficiency Disorders (IDD) are the world's leading cause of preventable brain damage and impaired psychomotor development in young children.¹¹⁴ In its most extreme form, iodine deficiency causes cretinism. It also increases the risks of stillbirth and miscarriage in pregnant women. Iodine deficiency is most commonly and visibly associated with goitre. IDD takes its greatest toll in impaired mental growth and development, contributing to poor learning outcomes, reduced intellectual ability, and impaired work performance.¹¹⁵ The indicator reported in MICS is the percentage of households consuming iodized salt as assessed using rapid test kits.

In Eswatini MICS, 2021-2022, salt used for cooking in the household was tested for presence of iodine using rapid test kits for potassium iodate. Table TC.9.1 presents the percent distribution of households by consumption of iodized salt.

7.9 EARLY CHILDHOOD DEVELOPMENT

It is well recognized that a period of rapid brain development occurs in the first years of life, and the quality of children's home environment and their interactions with caregivers is a major determinant of their development during this period.¹¹⁶ Children's early experiences with responsive caregiving serves an important neurological function and these interactions can boost cognitive, physical, social and emotional development.¹¹⁷ In this context, engagement of adults in activities with children, presence of books and playthings in the home for the child, and the conditions of care are important indicators.

Information on a number of activities that provide children with early stimulation and responsive care was collected in the survey and presented in Table TC.10.1. These included the involvement of adult members of the household with children in the following activities: reading books or looking at picture books, telling stories, singing songs, taking children outside the home, compound or yard, playing with children, and spending time with children naming, counting, or drawing things. It should be noted that the questionnaire module did not cover activities that children engage in with adults that are not members of the household, even if such frequently or even daily are taking care of the children.

Exposure to books in early years not only provides children with greater understanding of the nature of print but may also give them opportunities to see others reading, such as older siblings doing schoolwork. Presence of books is important for later school performance. The mothers/caretakers of all children under 5 were asked about the number of children's books or picture books they have for the child, and the types of playthings that are available at home. The findings are presented in Table TC.10.2.

Some research has found that leaving children without adequate supervision is a risk factor for unintentional injuries.¹¹⁸ In MICS, two questions were asked to find out whether children age 0-59 months were left alone during the week preceding the interview, and whether children were left in the care of other children under 10 years of age. This is presented in Table TC.10.3.

7.10 EARLY CHILD DEVELOPMENT INDEX

Early childhood development is a multidimensional process that involves an ordered progression of motor, cognitive, language, socio-emotional and regulatory skills and capacities across the first few years of life.¹¹⁹ While these are distinct domains of early childhood development, they are interconnected. Nurturing and supporting all these dimensions in a holistic manner is key to ensuring children have the best chance to reach their full potential. Physical growth, literacy and numeracy skills, socio-emotional development and learning readiness set the trajectory for lifelong health, learning and well-being.¹²⁰

The Early Childhood Development Index 2030 (ECDI2030) module captures the achievement of key developmental milestones by children between the ages of 24 and 59 months. The data generated by the ECDI2030 can be used for monitoring and reporting on SDG indicator 4.2.1, and to inform government efforts to improve developmental outcomes among children.

The measure includes 20 questions about the way children behave in certain everyday situations, and the skills and knowledge they have acquired, reflecting the increasing difficulty of the skills children acquire as they grow. The 20 items are organized according to the three general domains of health, learning and psychosocial well-being. A child is considered to be developmentally on track if they have achieved the minimum number of milestones expected for their age group. Each of the three general domains is composed of a set of core sub-domains:

- Health sub-domains: gross motor development, fine motor development and self-care.
- Learning sub-domains: expressive language, literacy, numeracy, pre-writing, and executive functioning.
- Psychosocial well-being sub-domains: emotional skills, social skills, internalizing behavior, and externalizing behavior.

The ECDI2030 module is not designed to report on individual domains separately. Rather, it is meant to produce a single summary score that captures the interlinked developmental concepts embedded in the three domains mentioned in SDG 4.2.1.¹²¹

The indicator derived from the ECDI2030 module is the percentage of children aged 24 to 59 months who have achieved the minimum number of milestones expected for their age group¹²². The findings are presented in Table TC.11.1.

¹¹⁹ UNICEF et al. *Advancing Early Childhood Development: From Science to Scale*. Executive Summary, The Lancet, 2016. https://www.thelancet.com/pb-assets/Lancet/stories/series/ecd/Lancet_ECD_Executive_Summary.pdf.

¹²⁰ Shonkoff, J. and D. Phillips. *From Neurons to Neighborhoods: The Science of Early Childhood Development*. Washington, D.C.: National Academy Press, 2000.; United Nations Children's Fund, *Early Moments Matter*, New York: UNICEF, 2017.

¹²¹ For details about the development of the ECDI2030 module and related indicator, see 'ECDI2030-Frequently-Asked-Questions': <https://data.unicef.org/resources/early-childhood-development-index-2030-ecdi2030/>

¹²² The indicator generated by the ECDI2030 module is not entirely comparable to the one generated by the ECDI module that was introduced in the MICS surveys in 2009. For more information see 'ECDI2030-Frequently-Asked-Questions'.

8.1 EARLY CHILDHOOD EDUCATION

Readiness of children for primary school can be improved through attendance to early childhood education programmes or through pre-school. Early childhood education programmes include programmes for children that have organised learning components as opposed to baby-sitting and day-care which do not typically have organised education and learning.

In Eswatini, there are about 1,400 Early childhood education (ECE) centres distributed evenly across the four regions of the country. There are a variety of centre types that provide ECE services, as listed below:

- ✓ Church or mission
- ✓ Community
- ✓ Government owned
- ✓ Home-based (individuals)
- ✓ Neighbourhood Care Point (NCPs)
- ✓ Private (non-church based, non-governmental organisations)
- ✓ Other (e.g., day-care centres, community ECCDE centres)

The most common types are the community and NCP centres and a majority of the centres have their own building. According to the 2021 Mapping of Early Childhood Care Development and Education (ECCDE) Centres in Eswatini report, financing of ECCDE¹²³ centres is mostly independent, with only 6% of them receiving regular government support. The financial support is mostly for NCPs, as well as community ECCDE centres such as Kagogo and Indlunkhulu.

In Eswatini, the Early childhood education program consists of Pre-primary Level 1, Pre-primary Level 2, Grade 0 (year preceding primary school) and day-care.

Government policies, strategies and plans that governs the ECE program include the following:

- ✓ National Education and Training Sector Policy, 2018
- ✓ Education Sector Strategic Plan (2022-2034)
- ✓ Multisectoral ECCD framework 2021-20225
- ✓ Swaziland Early Learning and Development Standards, 2013

A child currently attending school is a child who regularly attends school at the time of the survey. If the child is not attending school at the time of the interview due to school holidays or breaks, but the child regularly attends school, the child is considered as currently attending school. This indicator is based on question UB8 in the Questionnaire for Children Under 5.

Table LN.1.1 shows the percent of children age 3 and 4 years currently attending early childhood education.

Table LN.1.2 looks at children's exposure to organised learning programmes in the year before the official primary entry age. The official primary school entry age in Eswatini is age 6 years. Table LN.1.2

¹²³ Early Childhood Care Development and Education (ECCDE) includes ECE.

therefore refers to children who were 5 years old at the beginning of the school year.¹²⁴ In Eswatini, the school year begins in January.

The indicator corresponds to SDG indicator 4.2.2: Participation rate in organized learning (one year before the official primary entry age) and is calculated as an adjusted¹²⁵ net attendance rate (ANAR). This indicator is based on question UB7 in the Questionnaire for Children Under 5.

Additionally, Table LN.1.2 presents the gender, wealth and area parity indices for SDG indicator 4.2.2. These indices contribute to SDG indicator 4.5.1: Parity indices (female/male, rural/urban, bottom/top wealth quintile and others such as disability status, indigenous peoples and conflict-affected, as data become available) for all education indicators that can be disaggregated. Generally, when a parity index value falls between 0.97 and 1.03, it is regarded as parity between two groups. The likely more disadvantaged group (e.g., female, poor and rural) is placed in the numerator, so parity index values below 0.97 indicate disadvantage for those groups. For example, in the gender parity index (GPI), a value between 0.97 and 1.03 indicates parity between the sexes, a GPI value lower than 0.97 indicates female disadvantage and a value greater than 1.03 suggests male disadvantage. The further from 1.00 that a parity index lies, the greater the disparity between groups. The indices do not reveal the overall indicator levels, as parity may be achieved, while overall levels for both groups are low.

Parity indices are also presented in Table LN.2.8 (for attendance to primary, lower and upper secondary school) and in Tables LN.4.1 and LN.4.2 (for reading and numeracy skills, respectively).

¹²⁴ In MICS, the age of household members is the age at the time of the survey. This determines eligibility for individual questionnaires, modules and questions. Age is also used to define indicators. However, to generate the majority of education-related indicators that are based on the age of children, e.g., adjusted net attendance rates, completion rates, etc., a variable is created to reflect the age at the beginning of the school year. This eliminates issues related to the timing and length of survey fieldwork and creates comparable findings across countries, while taking age-criteria for enrolment into account. Tables in this chapter specifically mention "Age at beginning of school year" in rows and columns where applicable, as compared to simply "age" in reference to age at the time of the survey.

¹²⁵ Rates presented in this table are "adjusted" since the numerator includes children one year younger than the official primary entry age attending either ECE or primary education.

Table LN.1.1: Early childhood education

8.2 ATTENDANCE

Ensuring that all girls and boys complete primary and secondary education is a target of the of the 2030 Agenda for Sustainable Development. Education is a vital prerequisite for combating poverty, empowering women, economic growth, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

In Eswatini, children enter primary school at age 6, lower secondary at age 13 and upper secondary school at age 16. There are 7 grades in primary school and 3 in lower secondary and 2 in upper secondary school. In primary school, grades are referred to as grade 1 to grade 7. For lower secondary school, grades are referred to as form 1 to form 3 and in upper secondary, form 4 to form 5. The school year typically runs from January to December of the same year.

To achieve comparability between varying national educational systems and classifications across the world, the United Nations Educational, Scientific and Cultural Organization (UNESCO) maintains the International Standard Classification of Education (ISCED) statistical framework. Its defined levels and coding are used in computation of MICS Indicators.¹²⁶ With focus on completion of primary and secondary education, indicators are centred on levels 0-3 presented in the table of classifications below.

ISCED 2011		Education system in Eswatini	
Level	ISCED Name	English	
0	Early childhood education and care	Grade zero	
		Pre-primary education	
1	Primary	Primary school (grade 1 - 7)	
2	Lower secondary	Lower secondary (form 1 - 3)	
3	Upper secondary	Upper secondary (form 4 - 5)	
The post-secondary level 4-8 are not detailed in this table, but include 4: Post-secondary non-tertiary, 5: Short-cycle tertiary, 6: Bachelor's or equivalent, 7: Master's or equivalent, and 8: Doctoral or equivalent			

Attendance to pre-primary education is important for the readiness of children to school. Table LN.2.1 shows the proportion of children in the first grade of primary school (regardless of age) who attended an early childhood education programme the previous year.¹²⁷

Table LN.2.2 presents the percentage of children of primary school entry age entering grade 1.

Table LN.2.3 provides the percentage of children of primary school age (6 to 12 years) who are attending primary or secondary school¹²⁸, and those who are out of school. Similarly, Table LN.2.4

¹²⁶ ISCED is periodically revised by UNESCO (latest in 2011) in consultation with countries. National ISCED mappings are published here: <http://uis.unesco.org/en/isced-mappings>.

¹²⁷ The computation of the indicator does not exclude repeaters, and therefore is inclusive of both children who are attending primary school for the first time, as well as those who were in the first grade of primary school the previous school year and are repeating. Children repeating may have attended pre-primary education prior to the school year during which they attended the first grade of primary school for the first time; these children are not captured in the numerator of the indicator.

¹²⁸ Rates presented in this table are "adjusted" since they include not only primary school attendance, but also lower and upper secondary school attendance in the numerator.

presents the percentage of children of lower secondary school age (age 13 to 15 years) who are attending lower secondary school or higher education levels¹²⁹, and those who are out of school.

In Table LN.2.5, children are distributed according to their age against current grade of attendance (age-for-grade). For example, an 8-year-old child (at the beginning of the school year) is expected to be in grade 3, as per the official intended age-for-grade. If this child is currently in grade 1, he/she will be classified over-age by 2 years. The table includes both primary and lower secondary levels.

Table LN.2.6 presents the percentage of children of upper secondary school age (age 16 to 17 years) who are attending upper secondary school or higher¹³⁰, and those who are out of school.

The gross intake ratio to the last grade of primary school, primary school completion rate and transition rate to secondary education are presented in Table LN.2.7. The gross intake ratio is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year.

The completion rate of primary education refers to the percentage of a cohort of children age 3 to 5 years above the official intended age for the last grade of primary education who have completed primary education. The intended age for the last grade of primary is the age at which children would enter the last grade of primary school if they had started school at the official primary entry age and had progressed without repeating or skipping a grade. In Eswatini, the official age of entry into primary school is age 6 years. With 7 grades in primary school, the intended age for the last grade of primary is therefore 12 years, and the reference group for the completion rate of primary education is children age 15 to 17 years. Completion rates are also presented for lower and upper secondary education. The official intended age for the last grades of lower and upper secondary school are 15 and 17 years, respectively. Thus, denominators for the lower and upper secondary completion rates are children age 18 to 20 years and children age 20 to 22 years, respectively.

The table also provides the “effective” transition rate¹³¹, defined as the percentage of children who continued to the next level of education – the number of children who are attending the first grade of the higher education level in the current school year and were in the last grade of the lower education level the previous year divided by the number of children who were in the last grade of the lower education level the previous school year and are not repeating that grade in the current year.

A low effective transition rate indicates that a low percentage of students are transitioning to the next level of education. This brings to light the existence of potential barriers in an education system including: financial burden such as enrolment fees or the obligation to purchase textbooks or school uniforms; education supply and quality issues such as a limited number of teachers or classrooms and low-quality teaching; as well as social and individual beliefs on education such as low expectation in returns of advancing in education.

¹²⁹ Rates presented in this table are “adjusted” since they include not only lower secondary school attendance, but also attendance to higher education levels in the numerator.

¹³⁰ Rates presented in this table are “adjusted” since they include not only upper secondary school attendance, but also attendance to higher education levels in the numerator.

¹³¹ The simple transition rate, which is no longer calculated in MICS, tends to underestimate pupils’ progression to secondary school as it assumes that the repeaters never reach secondary school.

Table LN.2.8 presents the gender parity indices for the adjusted primary and secondary net attendance rates provided in Tables LN.2.3, LN.2.4 and LN 2.6. It also presents additional parity indices contributing to SDG 4.5.1, as described for Table LN.1.2.

8.3 PARENTAL INVOLVEMENT

Parental involvement in their children's education is widely accepted to have a positive effect on their child's learning performance. For instance, reading activities at home have significant positive influences on reading achievement, language comprehension and expressive language skills.¹³² Research also shows that parental involvement in their child's literacy practices is a positive long-term predictor of later educational attainment.¹³³

Beyond learning activities at home, parental involvement that occurs in school (like participating in school meetings, talking with teachers, attending school meetings and volunteering in schools) can also benefit a student's performance.¹³⁴ Research studies have shown that, in the primary school age range, the impact of parental involvement in school activities can even be much bigger than differences associated with variations in the quality of schools, regardless of social class and ethnic group.¹³⁵

The PR module included in the Questionnaire for children age 5-17 years was developed and tested for inclusion in MICS6. The work is described in detail in MICS Methodological Papers, No. 5.¹³⁶

Table LN.3.1 presents percentages of children age 7-14 years for whom an adult household member received a report card and was involved in school management and school activities in the last year, including discussion with teachers on children's progress.

In Table LN.3.2 reasons for children unable to attend class due to a school-related reasons are presented. Reasons include natural and man-made disaster, teacher strike and teacher absenteeism.

Lastly, Table LN.3.3 shows learning environment at home, i.e., percentage of children with 3 or more books to read, percentage of children who have homework, percentage whose teachers teach in the language that the child speaks at home, and percentage of children who receive help with homework.

Table LN.3.1: Parental involvement in school

Percentage of children age 7-14 years attending school and, among those, percentage of children for whom an adult member of the household received a report card for the child, and involvement of adults in school management and school activities in the last year, Eswatini MICS, 2021-2022

	Percentage of children attending school ^A	Number of children age 7-14	Percentage of children for whom an adult household member in the last year received a report card for the child ¹	Involvement by adult in school management in last year			Involvement by adult in school activities in last year		Number of children age 7-14 years attending school
				School has a governing body open to parents ²	Attended meeting called by governing body ³	A meeting discussed key education/financial issues ⁴	Attended school celebration or a sport event	Met with teachers to discuss child's progress ⁵

¹ MICS indicator LN.12 - Availability of information on children's school performance

² MICS indicator LN.13 - Opportunity to participate in school management

³ MICS indicator LN.14: Participation in school management

⁴ MICS indicator LN.15 - Effective participation in school management

⁵ MICS indicator LN.16 - Discussion with teachers regarding children's progress

^A As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

^B Attendance to school here is not directly comparable to adjusted net attendance rates reported in preceding tables, which utilise information on all children in the sample. This and subsequent tables present results of the Parental Involvement and Foundational Learning Skills modules administered to mothers or caretakers of a randomly selected subsample of children age 7-14 years.

^C School management sector was collected for children attending primary education or higher. Children out of school or attending ECE are not shown.

^D The categories of "Other" and "Missing/DK" in the background characteristic of "School management" have been suppressed from the table due to a small number of unweighted cases

^E The categories of "Vocational" and "DK/missing" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^F The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

na: not applicable

(*) Figures that are based on fewer than 25 unweighted cases

Table LN.3.2: School-related reasons for inability to attend class

Percentage of children age 7-14 years not able to attend class due to absence of teacher or school closure, by reason for inability, and percentage of adult household members contacting school officials or governing body representatives on instances of teacher strike or absence, Eswatini MICS, 2021-2022

	Percentage of children who in the last year could not attend class due to absence of teacher or school closure	Number of children age 7-14 years attending school	Percentage of children unable to attend class in the last year due to a school-related reason:							Number of children age 7-14 who could not attend class in the last year due to a school-related reason	Percentage of adult household members contacting school officials or governing body representatives on instances of teacher strike or absence ¹	Number of children age 7-14 years who could not attend class in the last year due to teacher strike or absence

³ MICS indicator LN.20 - School and home languages

⁴ MICS indicator LN.21 - Support with homework

^A This table utilises information collected in both the Parental Involvement and Foundational Learning Skills modules. Note that otherwise identical denominators may be slightly different, as the Foundational Learning Skills module includes consent of respondent to interview child and assent and availability of child to be interviewed. This invariably reduces the number of cases for data collected in this module.

^B As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

^C School management sector was collected for children attending primary education or higher. Children attending ECE are not shown.

8.4 FOUNDATIONAL LEARNING SKILLS

The ability to read and understand a simple text is one of the most fundamental skills a child can learn. Yet in many countries, students enrolled in school for as many as 6 years are unable to read and understand simple texts, as shown for instance by regional assessments such as the Latin American Laboratory for Assessment of the Quality of Education (LLECE), the Analysis Programme of the CONFEMEN Education Systems (PASEC) and the Southern and Eastern Africa Consortium for Monitoring Educational Quality (SACMEQ).¹³⁷ Acquiring literacy in the early grades of primary is crucial because doing so becomes more difficult in later grades, for those who are lagging behind.¹³⁸

A strong foundation in basic numeracy skills during the early grades is crucial for success in mathematics in the later years. Mathematics is a skill very much in demand and most competitive jobs require some level of skill in mathematics. Early mathematical knowledge is a primary predictor of later academic achievement and future success in mathematics is related to an early and strong conceptual foundation.¹³⁹

There are a number of existing tools for measuring learning outcomes¹⁴⁰ with each approach having their own strengths and limitations as well as varying levels of applicability to household surveys such as MICS. For some international assessments, it may just be too late: "Even though international testing programs like PISA and TIMSS are steadily increasing their coverage to also cover developing countries, (...) much of the divergence in test scores happens before the points in the educational trajectories of children where they are tested by international assessments", according to longitudinal surveys like the Young Lives Study.¹⁴¹ National assessments such as the Early Grade Reading Assessment, which happens earlier and is more context specific, will however be less appropriate for cross-country analysis; although it may be possible to compare children who do not complete an exercise (zero scores) set at a level which reflects each national target for children by a certain age or grade. Additionally, it is recognised that some assessments only capture children in school. However,

given that many children do not attend school, further data on these out-of-school children is needed and these can be adequately captured in household surveys.

The MICS Foundational Learning Skills module is designed to measure basic reading and numeracy skills expected upon completion of second grade of primary education.

The reading skills assessment is based on a short story and five comprehension questions (three literal and two inferential). The rationale, development, testing and validation of this module has been documented in two MICS Methodological Papers, No. 5¹³⁴ and No. 9¹⁴².

In MICS, 2021-2022, reading assessments were available in English and Siswati. The assessment tools were customised using the official Grade 2 textbooks for these languages, ensuring that the vocabulary was appropriate for Grade 2 learners, both in terms of complexity and cultural relevance.¹⁴³

Children were asked what language they mostly speak at home (home language) and children who had ever attended school were also asked what language is or was used most often for teaching in class (school language). Depending on children's school attendance different paths of selection of language for the first assessment were taken:

- Children who had ever attended school were assessed using the school language. If the assessment was not available in the school language reported, the child was assessed in the home language. If the home language was not available, the child was given a choice between the available languages.
- Children who had never attended school were assessed using the home language. If the home language was not available, the child was given a choice between the available languages.

Irrespective of school attendance, all children who failed the first assessment were provided the option to be assessed in the other available language.

The numeracy skills assessment is based on universal skills expected at Grade 2 level. The tool includes four mathematics tasks: number reading, number discrimination, addition and pattern recognition.

Tables LN.4.1 and LN.4.2 present percentages of children age 7-14 years, by sex, who correctly answered foundational reading tasks and numeracy skills, respectively. Tables LN.4.1.CS1 and LN.4.1.CS2 present percentages of children age 7-14 years with foundational learning skills in reading in English and in Siswati respectively. Age and school attendance, by level and grade are among the disaggregates shown and necessary to read some of the reported indicators. These MICS indicators are designed and developed to both inform national policy development and report on global SDG indicator 4.1.1(a): Proportion of children in grade 2/3 achieving a minimum proficiency in (i) reading and (ii) mathematics by sex.

The assessment score of reading tasks is further disaggregated by results of the literal questions and inferential questions. The disaggregation of numeracy skills such as number reading, number discrimination, addition and pattern recognitions are also available.

¹ MICS indicator LN.22a - Foundational reading and number skills (reading, age 7-14)

² MICS indicator LN.22b - Foundational reading and number skills (reading, age for grade 2/3)

³ MICS indicator LN.22c - Foundational reading and number skills (reading, attending grade 2/3); SDG indicator 4.1.1

⁴ MICS indicator LN.11a - Parity indices - reading, age 7-14 (gender); SDG indicator 4.5.1

⁵ MICS indicator LN.11a - Parity indices - reading, age for grade 2/3 (gender); SDG indicator 4.5.1

⁶ MICS indicator LN.11a - Parity indices - reading, attending grade 2/3 (gender); SDG indicator 4.5.1

⁷ MICS indicator LN.11b - Parity indices - reading, age 7-14 (wealth); SDG indicator 4.5.1

⁸ MICS indicator LN.11c - Parity indices - reading, age 7-14 (area); SDG indicator 4.5.1

⁹ MICS indicator LN.11d - Parity indices - reading, age 7-14 (functioning); SDG indicator 4.5.1

^A The reading tasks were available in English and Siswati. Children were assessed in the language (mainly) spoken by teachers or alternatively in the language (mainly) spoken at home. Children for whom both indicated languages were not available for assessment are recorded here, though children may subsequently have elected to attempt the assessment in one of available languages.

^B As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

^C School management sector was collected for children attending primary education or higher. Children attending ECE are not shown.

^D The categories of "Other" and "Missing/DK" in the background characteristic of "School management" have been suppressed from the table due to a small number of unweighted cases

^E The categories of "Vocational" and "DK/missing" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^F The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

na: not applicable

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

¹ Country specific indicator LN.S5 - Foundational reading (Siswati) and number skills (reading, age 7-14)

² Country specific indicator LN.S6 - Foundational reading (Siswati) and number skills (reading, age for grade 2/3)

³ Country specific indicator LN.S7 - Foundational reading (Siswati) and number skills (reading, attending grade 2/3)

⁴ Country specific indicator LN.11a - Parity indices - reading (Siswati), age 7-14 (gender)

⁵ Country specific indicator LN.11a - Parity indices - reading (Siswati), age for grade 2/3 (gender)

⁶ Country specific indicator LN.11a - Parity indices - reading (Siswati), attending grade 2/3 (gender)

⁷ Country specific indicator LN.11b - Parity indices - reading (Siswati), age 7-14 (wealth)

⁸ Country specific indicator LN.11c - Parity indices - reading (Siswati), age 7-14 (area)

⁹ Country specific indicator LN.11d - Parity indices - reading (Siswati), age 7-14 (functioning)

^A The reading tasks were available in English and Siswati. Children were assessed in the language (mainly) spoken by teachers or alternatively in the language (mainly) spoken at home. Children for whom both indicated languages were not available for assessment are recorded here, though children may subsequently have elected to attempt the assessment in one of available languages.

^B As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

^C School management sector was collected for children attending primary education or higher. Children attending ECE are not shown.

^D The categories of "Other" and "Missing/DK" in the background characteristic of "School management" have been suppressed from the table due to a small number of unweighted cases

^E The categories of "Vocational" and "DK/missing" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^F The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

na: not applicable

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

'-' denotes 0 unweighted case in the denominator

² MICS indicator LN.22e - Foundational reading and number skills (numeracy, age for grade 2/3)

³ MICS indicator LN.22f - Foundational reading and number skills (numeracy, attending grade 2/3); SDG indicator 4.1.1

⁴ MICS indicator LN.11a - Parity indices - numeracy, age 7-14 (gender); SDG indicator 4.5.1

⁵ MICS indicator LN.11b - Parity indices - numeracy, age 7-14 (wealth); SDG indicator 4.5.1

⁶ MICS indicator LN.11c - Parity indices - numeracy, age 7-14 (area); SDG indicator 4.5.1

⁷ MICS indicator LN.11d - Parity indices - numeracy, age 7-14 (functioning); SDG indicator 4.5.1

⁸ MICS indicator LN.11c - Parity indices - numeracy, age 7-14 (area); SDG indicator 4.5.1

⁹ MICS indicator LN.11d - Parity indices - numeracy, age 7-14 (functioning); SDG indicator 4.5.1

^A As eligibility for the Parental Involvement and Foundational Learning Skills modules was determined based on age at time of interview (age 7-14 years), the disaggregate of Age at beginning of school year inevitably presents children who were age 6 years at the beginning of the school year.

^B School management sector was collected for children attending primary education or higher. Children attending ECE are not shown.

^C The categories of "Other" and "Missing/DK" in the background characteristic of "School management" have been suppressed from the table due to a small number of unweighted cases

^D The categories of "Vocational" and "DK/missing" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^E The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

na: not applicable

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

'-' denotes 0 unweighted case in the denominator

8.5 LINKING MICS AND EDUCATION MANAGEMENT INFORMATION SYSTEM DATA

The Eswatini 2021-22 MICS piloted a new MICS Programme initiative to integrate household survey data and administrative records: MICS Link. The pilot makes it possible to combine data from the MICS and the Education Management Information System (EMIS), increasing the potential analytical applications of both data sources.

MICS and EMIS collect complementary information on the factors affecting children's education and learning outcomes. While MICS captures socio-economic information about children and adolescents, their learning environment at home, their foundational learning skills or their parents' involvement in education, EMIS gathers data about multiple dimensions of the education system, including for example information on a school's management, student enrolment, teacher's qualifications, or equipment and facilities. Bringing together data from these two sources can help better understand the relationship between educational outcomes, school conditions and the socio-economic characteristics of children and their households.

The Eswatini EMIS Unit under the Ministry of Education and Training (MoET) is responsible for the collection of data and information from the education and training sector. One of the main surveys of the EMIS Unit is the annual education census (AEC) that covers all schools (public and private) in the country registered with the MoET. The AEC data is collected through paper forms that are sent to schools the last day of school in March, through the Regional Education Offices (REO). REOs receive completed forms from schools, and these are sent back to the central EMIS Unit where information is entered digitally. EMIS information is available at <https://www.emis.co.sz/>

Enabling the link of the MICS and EMIS datasets required the following steps:

- Four questions (ED10C-ED10F) were added to the Education module of the MICS Household Questionnaire to collect the location (country, region and *inkhundla*) and the name of the school attended by primary- and secondary-school going children in the household.
- The EMIS Unit compiled a list with the school identifiers (school code, name and location) of all primary and secondary schools registered with the MoET.
- The list compiled by the EMIS Unit was then integrated into the CAPI entry application system of the MICS and used to populate a dropdown menu from which interviewers could easily find and select schools using the location and name provided by respondents.

Table LN.5.1 presents the percentage of children attending primary or secondary education for whom their school records are available in the EMIS database. Table LN.5.2 presents the percentage of children who attend schools located either within or outside their region of residence in Eswatini, and the percentage of children who attend schools located outside of the country.

The information presented in tables LN.5.1 and LN.5.2 is based exclusively on information captured in the Eswatini MICS, 2021-2022 dataset.

However, by enabling data integration between MICS and EMIS through the Eswatini MICS, 2021-2022, the Government of Eswatini and its stakeholders will be able to link aggregate, non-personally

identifiable data from both sources, and conduct further analysis to inform and monitor education policies.

Given that the Eswatini MICS, 2021-2022 data was collected between September 2021 and March 2022, the school year of reference is (2021/2022) and as result only school data corresponding to the 2021 EAC should be integrated with the Eswatini MICS, 2021-2022 for joint analysis.

Table LN.5.1: Availability of school information

Percentage of children attending primary or secondary school for whom their school records are available in the Education Management Information Systems (EMIS) database, Eswatini MICS, 2021-2022

	Percentage of children attending primary or secondary school:		Total	Number of children currently attending primary or secondary or education

9.1 BIRTH REGISTRATION

A name and nationality is every child's right, enshrined in the Convention on the Rights of the Child (CRC) and other international treaties. Registering children at birth is the first step in securing their recognition before the law, safeguarding their rights, and ensuring that any violation of these rights does not go unnoticed.¹⁴⁴ Birth certificates are proof of registration and the first form of legal identity and are often required to access health care or education. Having legal identification can also be one form of protection from entering into marriage or the labour market, or being conscripted into the armed forces, before the legal age. Birth registration and certification is also legal proof of one's place of birth and family ties and thus necessary to obtain a passport. In adulthood, birth certificates may be required to obtain social assistance or a job in the formal sector, to buy or inherit property and to vote.

In Eswatini, to register a birth that occurred in a health institution, the family brings the notification of birth issued by the health institution to the Civil Registration Department (CRD). In addition, the parents must present their national identification cards. If they do not have a national identity card (ID) then they must register for that prior to registering the birth of their child. Registration for the Personal Identification Number (PIN) effectively enters them in the National Population Register (NPR), thus ensuring that the birth registration is linked to the new record.

The civil registration officer fills the birth registration form manually and a typist enters the information from the completed registration form into the NPR. Once in the system, the birth registration is complete, and the infant receives a birth certificate with a PIN.

In the case of a stillbirth, the family receives a Medical Certificate of Cause of Death (MCCoD) or Birth, Marriage and Death (BMD)-11 form signed by medical personnel and uses this documentation to register the stillbirth at CRD. BMD 11 is only applicable at facilities that have not yet transitioned to International Classification of Diseases (ICD) 11 or use of the MCCoD.

For a birth that occurred outside of a health institution, the process is similar to a birth in a health institution, except that the family does not obtain a proof of birth issued during delivery and instead produces the letter they have obtained from Indvuna/Chief.

¹⁴⁴ UNICEF. *Every Child's Birth Right: Inequities and trends in birth registration*. New York: UNICEF, 2013. https://www.unicef.org/publications/files/Birth_Registration_11_Dec_13.pdf.

¹ MICS indicator PR.1 - Birth registration; SDG indicator 16.9.1

^A The categories of "Vocational" and "Dk/ Missing" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^B Children age 0-1 years are excluded, as functional difficulties are only collected for age 2-4 years.

^C The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

9.2 CHILD DISCIPLINE

Teaching children self-control and acceptable behaviour is an integral part of child discipline in all cultures. Positive parenting practices involve providing guidance on how to handle emotions or conflicts in manners that encourage judgment and responsibility and preserve children's self-esteem, physical and psychological integrity and dignity. Too often however, children are raised using punitive methods that rely on the use of physical force or verbal intimidation to obtain desired behaviours. Studies¹⁴⁵ have found that exposing children to violent discipline has harmful consequences, which range from immediate impacts to long-term harm that children carry forward into adult life. Violence hampers children's development, learning abilities and school performance; it inhibits positive relationships, provokes low self-esteem, emotional distress and depression; and, at times, it leads to risk taking and self-harm.

In the Eswatini MICS 2021-2022, mothers or caretakers of children under age five and of one randomly selected child age 5-17 were asked a series of questions on the methods adults in the household used to discipline the child during the past month and if the respondent believes that physical punishment is a necessary part of child-rearing. Tables PR.2.1 and PR.2.2 present the results.

9.3 CHILD LABOUR

Children around the world are routinely engaged in paid and unpaid forms of work that are not harmful to them. However, they are classified as child labourers when they are either too young to work or are involved in hazardous activities that may compromise their physical, mental, social or educational development. Article 32 (1) of the CRC states: "States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development".

The government of Eswatini has made several independent efforts to reduce child labour. In 1980, the Employment Act was passed, mandating that children are not to be employed for any industrial work, unless the child was a direct family member of the employer, or the work was primarily educational. The Employment Act defines a child as a person under the age of 15. For non-industrial labour, the Act made it illegal to employ children during school hours, for night shifts, for more than 6 hours a day or 33 hours a week, or for more than four hours continuously without an hour-long break. Additionally, the Employment Act outlines restrictions for hiring "young persons," defined as those over the age of 15 but under 18. Again, educational value is the main exception to the restrictions, as apprenticeship or vocational training may be approved by the Minister. Both children and young people are prohibited from work that is underground, involves selling alcohol, or is dangerous to their physical or emotional wellbeing.

The child labour module was administered for one randomly selected child age 5-17 years in each household and includes questions on the type of work a child does and the number of hours he or she is engaged in it. Data are collected on both economic activities (paid or unpaid work for someone who is not a member of the household, work for a family farm or business) and domestic work (household chores such as cooking, cleaning or caring for children, as well as collecting firewood or fetching water).^{146,147,148}

Table PR.3.1 presents children's involvement in economic activities. The methodology of the MICS Indicator on Child labour uses three age-specific thresholds for the number of hours children can perform economic activity without being classified as child labourers. A child that performed economic activities during the last week for more than the age-specific number of hours is classified as in child labour:

- i. age 5-11: 1 hour or more
- ii. age 12-14: 14 hours or more
- iii. age 15-17: 43 hours or more

¹⁴⁶ 'Own use production of goods', including activities such as fetching water and collecting firewood, falls within the production boundary set by the United Nations System of National Accounts. However, for the purpose of SDG reporting of indicator 8.7.1, and with the goal of facilitating international comparability, fetching water and collecting firewood have been classified as unpaid household services (i.e., household chores), a form of production that lies outside the production boundary.

¹⁴⁷ UNICEF. *How Sensitive Are Estimates of Child Labour to Definitions?*. MICS Methodological Paper No. 1. New York: UNICEF, 2012. https://data.unicef.org/wp-content/uploads/2015/12/Child_Labour_Paper_No.1_FINAL_162.pdf.

¹⁴⁸ The Child Labour module was administered in the Questionnaire for Children Age 5-17 (See Appendix E: Questionnaires). In households with at least one child age 5-17, one child was randomly selected. To account for the random selection, the household sample weight is multiplied by the total number of children age 5-17 in each household; this weight is used when producing the relevant tables.

Table PR.3.2 presents children’s involvement in household chores. As for economic activity above, the methodology also uses age-specific thresholds for the number of hours children can perform household chores without being classified as child labourers. A child that performed household chores during the last week for more than the age-specific number of hours is classified as in child labour.¹⁴⁹

- i. age 5-11 and age 12-14: 21 hours or more
- ii. age 15-17: No limit to number of hours

SDG Target 8.7 aims to “take immediate and effective measures to eradicate forced labour, end modern slavery and human trafficking and secure the prohibition and elimination of the worst forms of child labour, including recruitment and use of child soldiers, and by 2025 end child labour in all its forms.” The SDG indicator 8.7.1 provides the proportion of children age 5-17 years who are engaged in child labour. Two measures of the indicator are presently in use, the first based on the production boundary set by the United Nations System of National Accounts (using above age-thresholds on economic activities alone) and the second based on the general production boundary (classifying as child labour if age-specific thresholds are exceeded on either or both economic activities or household chores). Table PR.3.3 presents both of these two measures. The MICS Indicator PR.3 is based on the second, i.e. using the general production boundary.

Two country specific questions were added in the child labour module to capture children engaged in herding animals and the time they spent on that. Table PR.3.CS1 presents among children 5-17 engaged in economic activity or in herding animals, the percentage of children engaged in each type of activity.

Table PR.3.CS2 presents percentage of children’s involvement in herding animals. The following three age-specific thresholds for the number of hours children perform this activity during the last were considered:

- i. age 5-11: 1 hour or more
- ii. age 12-14: 14 hours or more
- iii. age 15-17: 43 hours or more

Children may be driven into work for various reasons. Most often, child labour occurs when families face economic and financial challenges – whether due to unemployment, sudden illness or job loss of a caregiver. The government of Eswatini has also made several efforts to reduce child labour. In 1980, the Employment Act was enacted, mandating that children are not employed for any industrial work, unless the child was a direct family member of the employer, or the work was primarily educational.

Pertaining to the overall concept of child labour, the module also collects information on hazardous working conditions. Table PR.3.4 presents the percentage of children involved in each of the hazardous activities included in the survey. Note, however, that the present definition, also used for SDG reporting, does not include involvement in hazardous working conditions, as further methodological work is needed to validate questions specifically aimed at identifying children working under such hazardous conditions.

¹⁴⁹ Note that the age-specific thresholds for household chores have changed during the implementation of the sixth round of MICS. Comparison to other data sources, including previous MICS surveys, should be done with caution.

¹ MICS indicator PR.3 - Child labour; SDG indicator 8.7.1

^A The definition of child labour used for SDG reporting does not include hazardous working conditions. This is a change over previously defined MICS6 indicator.

^B Includes attendance to early childhood education

^C The disaggregate of Mother's education is not available for children age 15-17 years identified as emancipated.

^D The categories of "Vocational" and "Dk/ Missing" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^E The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e., individually interviewed women age 18-49 years and men age 18-49 years in selected households.

Table PR.3.CS1: Type of economic activity

Percentage of children age 5-17 years involved in economic activities or in herding animals by type of activity, Eswatini MICS, 2021-2022

^A The definition of child labour used for SDG reporting does not include hazardous working conditions or the country specific work condition category of working in the rain. This is a change over previously defined MICS6 indicator. This column presents a definition comparable to the previous indicator. The SDG indicator is presented in Table PR.3.3.

^B Includes attendance to early childhood education

^C The disaggregate of Mother's education is not available for children age 15-17 years identified as emancipated.

^D The categories of "Vocational" and "Dk/ Missing" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^E The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

9.4 CHILD MARRIAGE

Marriage¹⁵⁰ before the age of 18 is violation of human rights yet remains a reality for many children. The right to 'free and full' consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be 'free and full' when one of the parties involved is not sufficiently mature to make an informed decision about a life partner. In the Sustainable Development Goals, child marriage has been identified as a harmful practice which the world should aim to eliminate by 2030.

Child marriage is more common among girls than boys but does occur around the world among children of both sexes. The impacts specific to boys married in childhood are not yet well understood, but marriage does place boys in an adult role accompanied by responsibilities for which they may not be prepared.

In many parts of the world parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage compromises the development of girls and often results in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty.¹⁵¹

Closely related to the issue of child marriage is the age at which sexual activity – and for females, childbearing – may begin. Women who were married before the age of 18 tend to have more children than those who marry later in life and are less likely to receive maternal health care services.^{152,153} In addition, pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19.

Tables PR.4.1W and PR.4.1M present the percentage of women and men married before ages 15 and 18 years, the percentage of adolescent girls and boys age 15-19 years who are currently married, and the percentage of women in a polygynous union.

Tables PR.4.2W and PR.4.2M present, respectively, the proportion of women and men who were first married or entered into a marital union before age 15 and 18 by area and age groups. Examining the percentages married before ages 15 and 18 across different age groups allow for trends to be observed in child marriage over time.

Another component is the spousal age difference with the indicator being the percentage of married/in union women 10 or more years younger than their current spouse. With a very low prevalence of child marriage, table PR.4.3, which should present the results of the age difference between women and their husband or partner, has not been produced.

¹⁵⁰ All references to marriage in this chapter include cohabiting unions as well.

9.5 VICTIMISATION

Crime can have a large impact on the lives of victims and the wider community in which they live. Those who are victims of crimes can suffer physically and psychologically and experience loss of assets and income. Crime can also carry significant economic costs to the community through the provision of preventative measures as well as corrective services¹⁵⁴.

Tables PR.6.1W and PR.6.1M present the percentage of women and men who were victims of robbery or assault in the last 3 and 1 year prior to the survey, by various background characteristics. Tables PR.6.2W and PR.6.2M show if weapons (namely, knife, gun or other weapons) were used during the last robbery. As the percentages of women and men experiencing assault in the last 3 years and those experiencing robbery or assault the last year are low, tables 6.3W, 6.3M, 6.4W, 6.4M are not presented.

¹⁵⁴ United Nations Office on Drugs and Crime, and United Nations Economic Commission for Europe. *Manual on Victimization Surveys*. Geneva: UN. https://www.unodc.org/documents/data-and-analysis/Crime-statistics/Manual_on_Victimization_surveys_2009_web.pdf.

Table PR.6.1W: Victims of robbery and assault (women)

¹ MICS indicator PR.12 - Experience of robbery and assault
^A A robbery is here defined as "taking or trying to take something, by using force or threatening to use force".

^B An assault is here defined as a physical attack.

^C The category of "Vocational" in the background characteristic of "Education" has been suppressed from the table due to a small number of unweighted cases

() Figures that are based on 25-49 unweighted cases

9.6 FEELINGS OF SAFETY

Questions about fear, such as feelings of safety and perceptions of crime as a problem, indicate respondents' level of perceived safety in everyday life. This is important as such perceptions limit people's freedom of movement and influence how they manage threats to their safety¹⁵⁴.

Tables PR.7.1W and PR.7.1M present data for women and men on their feelings of safety for walking alone in their neighbourhood after dark and for being at home alone after dark.

Table PR.7.1W: Feelings of safety (women)

Percent distribution of women age 15-49 years by feeling of safety walking alone in their neighbourhood after dark and being home alone after dark, Eswatini MICS, 2021-2022

	Percent distribution of women who walking alone in their neighbourhood after dark feel:						Percentage of women who feel safe walking alone in their neighbourhood after dark ¹	Percent distribution of women who being home alone after dark feel:						Percentage of women who after dark feel very unsafe walking alone in their neighborhood or being home alone	Number of women	
	Very safe	Safe	Unsafe	Very unsafe	Never walk alone after dark	Total		Very safe	Safe	Unsafe	Very unsafe	Never home alone after dark	Total

9.7 ATTITUDES TOWARDS DOMESTIC VIOLENCE, DECISION MAKING AND VIOLENCE AGAINST GIRLS AND WOMEN

Eswatini MICS 2021-2022 assessed the attitudes of women and men age 15-49 years towards wife/partner beating by asking the respondents whether they think that husbands/partners are justified to hit or beat their wives/partners in a variety of situations. The purpose of these questions is to capture the social justification of violence (in contexts where women have a lower status in society) as a disciplinary action when a woman does not comply with certain expected gender roles. The responses to these questions can be found in Table PR.8.1W for women and in Table PR.8.1M for men.

Eswatini MICS 2021-2022 included a module on Gender Violence. It includes some questions obtained from the Demographic and Health Survey (DHS) Domestic violence (DV) module with some country-specific questions added. Table PR.8.CS1 provides responses on women taking own decisions regarding sexual relations, contraceptive use and reproductive health care. Table PR.8.CS2 is on women whose husbands have ever demonstrated specific types of controlling behaviours. Tables PR.8.CS 3, PR.8.CS4, PR.8.CS5 and PR.8.CS6 provides information on the women who experienced physical and sexual violence, persons committing the type of violence and age of first encounter with the violence.

Table PR.8.1W: Attitudes toward domestic violence (women)

Percentage of women age 15-49 years who believe a husband is justified in beating his wife in various circumstances, Eswatini MICS, 2021-2022

	Percentage of women who believe a husband is justified in beating his wife:											Number of women
	If she goes out without telling him	If she neglects the children	If she argues with him	If she refuses sex with him	If she burns the food	For any of these five reasons ¹	If she rejects or ends the relationship with him	If she sleeps with another man	If she initiates sex	If she refuses to give food	For any of these nine reasons ^{2,A}

10.1 DRINKING WATER

Access to safe drinking water, sanitation and hygiene (WASH) is essential for good health, welfare and productivity and is widely recognised as a human right¹⁵⁵. Inadequate WASH is primarily responsible for the transmission of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid and polio. Diarrhoeal diseases exacerbate malnutrition and remain a leading global cause of child deaths.

Drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development. While improving water quality is critical to prevent disease, improving the accessibility and availability of drinking water is equally important, particularly for women and girls who usually bear the primary responsibility for carrying water, often for long distances.¹⁵⁶

The SDG targets relating to drinking water are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.1). For more information on global targets and indicators please visit the website of the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.¹⁵⁷

The distribution of the population by main source of drinking water is shown in Table WS.1.1. The population using *improved sources* of drinking water are those using any of the following types of supply: piped water (into dwelling, compound, yard or plot, to neighbour, public tap/standpipe), tube well/borehole, protected dug well, protected spring, rainwater collection, and packaged or delivered water¹⁵⁸.

Table WS 1.2 shows the amount of time taken per round trip to collect water for users of improved and unimproved sources. Household members using improved water sources located on premises or requiring up to and including 30 minutes per trip for water collection meet the SDG criteria for a 'basic' drinking water service.

Table WS.1.3 presents the sex and age of the household member usually responsible for water collection among household members without water sources on premises. Table WS 1.4 shows the average time spent each day by the household member mainly responsible for collecting drinking water.

Table WS.1.5 shows the proportion of household members with sufficient water available when needed from their main source of drinking water and the main reasons household members are unable to access water in sufficient quantities when needed.

¹⁵⁵ The human rights to water and sanitation were explicitly recognised by the UN General Assembly and Human Rights Council in 2010 and in 2015.

¹⁵⁶ WHO, and UNICEF. *Safely Managed Drinking Water: thematic report on drinking water*. Geneva: WHO Press, 2017. <https://data.unicef.org/wp-content/uploads/2017/03/safely-managed-drinking-water-JMP-2017-1.pdf>.

¹⁵⁷ "Home." JMP. Accessed September 06, 2018. <https://washdata.org/>.

¹⁵⁸ Packaged water (bottled water and sachet water) and delivered water (tanker truck and cart with small drum/tank) are treated as improved based in new SDG definition.

Table WS.1.6 presents the proportion of household members with an indicator of faecal contamination detected in their drinking water source. The risk of faecal contamination is shown based on the number of *Escherichia coli* (*E. coli*) bacteria detected, ranging from low (<1 *E. coli* per 100 mL), to moderate (1-10 *E. coli* per 100 mL), high (11-100 *E. coli* per 100 mL) and very high risk (>100 *E. coli* per 100 mL). Table WS.1.7 shows the proportion of household members with *E. coli* detected in their household drinking water. Contamination may occur between the source and the household during transport, handling and storage.

Table WS.1.8 shows the proportion of household population with improved and unimproved drinking water sources located on premises, available when needed, and free from contamination. Households with improved sources accessible on premises, with sufficient quantities of water available when needed, and free from contamination meet the SDG criteria for 'safely managed' drinking water services.

Table WS.1.9 presents the main methods by which households report treating water in order to make it safer to drink. Boiling water, adding bleach or chlorine, using a water filter, and using solar disinfection are considered appropriate methods of water.

Table WS.1.1: Use of improved and unimproved water sources

Percent distribution of household population by main source of drinking water and percentage of household population using improved drinking water sources, Eswatini MICS, 2021-2022

10.2 HANDWASHING

Handwashing with water and soap is the most cost-effective health intervention to reduce both the incidence of diarrhoea and pneumonia in children under five¹⁵⁹. It is most effective when done using water and soap after visiting a toilet or cleaning a child, before eating or handling food and before feeding a child. Direct observation of handwashing behaviour at these critical times is challenging. A reliable alternative to observations is assessing the likelihood that correct handwashing behaviour takes place by asking to see the place where people wash their hands and observing whether water and soap (or other local cleansing materials) are available at this place^{160,161}.

Hygiene was omitted from the MDGs but has been included in the SDG targets which aim to achieve universal access to a basic handwashing facility at home (SDG 1.4 and 6.2).

Table WS.2.1 shows the proportion of household members with fixed or mobile handwashing facilities observed on premises (in the dwelling, yard or plot). It also shows the proportion of handwashing facilities where water and soap were observed. Household members with a handwashing facility on premises with soap and water available meet the SDG criteria for a 'basic' handwashing facility.

Table WS2.CS1 shows the main reasons that the household members are unable to access water for handwashing in sufficient quantities while table WS2.CS2 shows the main reasons that the household members are unable to access to sufficient soap.

¹⁵⁹ Cairncross, S. and V. Valdmanis. "Water supply, sanitation and hygiene promotion Chapter 41." in *Disease Control Priorities in Developing Countries. 2nd Edition*, edited by Jameson et al. Washington (DC): The International Bank for Reconstruction and Development / The World Bank.

¹⁶⁰ Ram, P. *Practical Guidance for Measuring Handwashing Behavior: 2013 Update*. Global Scaling Up Handwashing. Washington DC: World Bank Press, 2013.

¹⁶¹ Handwashing place or facilities may be fixed or mobile and include a sink with tap water, buckets with taps, tippy-taps, and jugs or basins designated for handwashing. Soap includes bar soap, liquid soap, powder detergent, and soapy water but does not include ash, soil, sand or other handwashing agents.

Table WS.2.1: Handwashing facility with soap and water on premises

Percent distribution of household members by observation of handwashing facility and percentage of household members by availability of water and soap or detergent at the handwashing facility, Eswatini MICS, 2021-2022

10.3 SANITATION

Unsafe management of human excreta and poor personal hygiene are closely associated with diarrhoea as well as parasitic infections, such as soil transmitted helminths (worms). Improved sanitation and hygiene can reduce diarrhoeal disease by more than a third¹⁶², and can substantially reduce the health impact of soil-transmitted helminth infection and a range of other neglected tropical diseases which affect over 1 billion people worldwide¹⁶³.

The SDG targets relating to sanitation are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.2).

An improved sanitation facility is defined as one that hygienically separates human excreta from human contact. Improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets. Table WS.3.1 shows the population using improved and unimproved sanitation facilities. It also shows the proportion who dispose of faeces in fields, forests, bushes, open water bodies of water, beaches or other open spaces, or with solid waste, a practice known as 'open defecation'.

Table WS. 3.2 presents the distribution of household population using improved and unimproved sanitation facilities which are private, shared with other households or public facilities. Those using shared or public improved sanitation facilities are classed as having a 'limited' service for the purpose of SDG monitoring. Households using improved sanitation facilities that are not shared with other households meet the SDG criteria for a 'basic' sanitation service, and may be considered 'safely managed' depending on how excreta are managed.

Table WS.3.3 shows the methods used for emptying and removal of excreta from improved pit latrines and septic tanks. Excreta from improved pit latrines and septic tanks that is never emptied (or don't know if ever emptied) or is emptied and buried in a covered pit is classed as 'safely disposed in situ' and meets the SDG criteria for a 'safely managed' sanitation service. Excreta from improved pit latrines and septic tanks that is removed by a service provider to treatment may also be safely managed, depending on the type of treatment received. Other methods of emptying and removal are not considered 'safely managed'.

Table WS.3.4 summarises the main ways in which excreta is managed from households with improved on-site sanitation systems (improved pit latrines and septic tanks) and compares these with the proportion with sewer connections, unimproved sanitation or practicing open defecation.

Table WS.3.5 shows the main methods used for disposal of child faeces among households with children aged 0-2 years. Appropriate methods for disposing of the stool include the child using a toilet or latrine and putting or rinsing the stool into a toilet or latrine. Putting disposable diapers with solid waste, a very common practice throughout the world, is only considered an appropriate

means of disposal if there is also a system in place for hygienic collection and disposal of the solid waste itself. This classification is currently under review.

The JMP has produced regular estimates of national, regional and global progress on drinking water, sanitation and hygiene (WASH) since 1990. The JMP service 'ladders' enable benchmarking and comparison of progress across countries at different stages of development. As of 2015, updated water and sanitation ladders have been introduced which build on established indicators and establish new rungs with additional criteria relating to service levels. A third ladder has also been introduced for handwashing hygiene¹⁶⁴. Table WS.3.6 summarises the percentages of household population meeting the SDG criteria for 'basic' drinking water, sanitation and handwashing services.

^A In many countries, disposal of children's faeces with solid waste is common. The risks vary between and within countries depending on whether solid waste is regularly collected and well managed; therefore, for the purposes of international comparability, solid waste is not considered safely disposed.

^B The categories of "Dk/Missing" and "Vocational" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

¹ MICS indicator WS.2 - Use of basic drinking water services; SDG Indicator 1.4.1

² MICS indicator WS.9 - Use of basic sanitation services; SDG indicators 1.4.1 & 6.2.1

^A For the purposes of calculating the ladders, "No permission to see / other" is included in the denominator.

^B Differs from the MICS indicator WS.7 "Handwashing facility with water and soap" (SDG indicators 1.4.1 & 6.2.1) as it includes "No permission to see / other". See table WS2.1 for MICS indicator WS.7

() Figures that are based on 25-49 unweighted cases

10.4 MENSTRUAL HYGIENE

The ability of women and adolescent girls to safely manage their monthly menstrual cycle in privacy and with dignity is fundamental to their health, psychosocial well-being and mobility. Women and girls who lack access to adequate menstrual hygiene management facilities and supplies experience stigma and social exclusion while also forgoing important educational, social and economic opportunities.¹⁶⁵

Table WS.4.1 shows the percentage of women and girls aged 15-49 who menstruated in the last 12 months reporting having a private place to wash and change while at home. It also presents whether they used appropriate materials including reusable and non-reusable materials during last menstruation. Table WS.4.2 shows the percentage of women who reported not being able to participate in social activities, school or work during their last menstruation.

¹⁶⁵ Sommer, M., C. Sutherland and V. Chandra-Mouli. "Putting Menarche and Girls into the Global Population Health Agenda." *Reproductive Health* 12, no. 1 (2015). doi:10.1186/s12978-015-0009-8.

Table WS.4.1: Menstrual hygiene management

Percent distribution of women age 15-49 years by use of materials during last menstruation, percentage using appropriate materials, percentage with a private place to wash and change while at home and percentage of women using appropriate menstrual hygiene materials with a private place to wash and change while at home, Eswatini MICS, 2021-2022

	Percent distribution of women by use of materials during last menstruation					Percentage of women using appropriate materials for menstrual management during last menstruation	Percentage of women with a private place to wash and change while at home	Percentage of women using appropriate menstrual hygiene materials with a private place to wash and change while at home ¹	Number of women who reported menstruating in the last 12 months

¹MICS indicator WS.13 - Exclusion from activities during menstruation

^A The category of "Vocational" in the background characteristic of "Education" has been suppressed from the table due to a small number of unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

11.1 CHILD FUNCTIONING

The Convention on the Rights of Persons with Disabilities¹⁶⁶ outlines States Parties' obligations to ensure the full realization of rights for children with disabilities on an equal basis with other children. The presence of functional difficulties may place children at risk of experiencing limited participation in an unaccommodating environment, and limit the fulfilment of their rights.

Eswatini MICS, 2021-2022 included child functioning modules intended to provide an estimate of the number/proportion of children with functional difficulties as reported by their mothers or primary caregivers. The module included in the Questionnaire for Children Under Five covered children between 2 and 4 years of age while a similar module is also included in the Questionnaire for Children Age 5-17.

Functional domains covered in Questionnaire for Children Under Five are as follows: Seeing, hearing, walking, fine motor, communication, learning, playing, and controlling behaviour while functional domains covered in Questionnaire for Children Age 5-17 are as follows: Seeing, hearing, walking, self-care, communication, learning, remembering, concentrating, accepting change, controlling behaviour, making friends, anxiety, and depression.

Tables EQ.1.1 and EQ.1.2 present the percentage of children by age group with functional difficulty by domain.

Table EQ.1.3 presents the percentage of children age 2-17 who use assistive devices and still have difficulty within the relevant functional domains.

Table EQ.1.4 is a summary table presenting the percentage of children by age group with functional difficulty.

^A Functional difficulty for children age 2-4 years are defined as having responded "A lot of difficulty" or "Cannot at all" to questions within all listed domains, except the last domain of controlling behaviour, for which the response category "A lot more" is considered a functional difficulty.

^B Children age 2 are excluded, as early childhood education attendance is only collected for age 3-4 years.

^C The categories of "Don't know/Missing" and "Vocational" in the background characteristic of "Mother's education" have been suppressed from the table due to a small number of unweighted cases

^D The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years and men age 18-49 years in selected households.

11.2 SOCIAL TRANSFERS

Social protection is the set of public and private policies and programmes aimed at preventing, reducing and eliminating economic and social vulnerabilities to poverty and deprivation. Increasing volatility at the macro and household level, the persistence of inequalities and exclusion, threats posed to sustainable development by climate change and changing population trends have heightened the relevance and political momentum for social protection globally.¹⁶⁷

Social transfers or external economic support can be defined as predictable direct transfers to individuals or households, both in-kind and cash (including cash for work and public work programmes) to protect and prevent individuals and households from being affected by shock and support the accumulation of human, productive and financial assets and includes various social protection schemes – examples in Eswatini include Old Age Grant, Disability Grant, Orphans and Vulnerable Children (OVC) Educational Grant, School feeding, and Neighbourhood Care Points, or any other types of ad-hoc support, excluding transfers or assistance from family members, relatives or neighbours.

Table EQ.2.4 presents the percentage of households who are aware and have received external economic support, as reported by the respondent to the Household Questionnaire. The percentage of household members living in households that received social transfers or benefits during the outbreak of COVID-19 since March 2020 is further shown in Table EQ.2.CS1, by type of transfers and benefits. The benefits also include school tuition or school related other support available for any household member age 5-24. This table is an approximation to the SDG indicator 1.3.1 which is the proportion of population covered by social protection floors/systems.

It is well known that social and economic shocks affect the health conditions of individuals and undermine household resilience. These shocks affect the capacity of families to care for their children and place barriers to services that stand in the way of achieving goals and progress for children. In particular poor households are vulnerable to the impacts of these shocks through the increased burden of health costs; the illness and death of household members, leading to labour constraints in the household and the further impoverishment of children who have lost one or both parents, or their primary caregiver; and other vulnerable children, cause them to drop out of school and engage in harmful child labour and other risky behaviours. As an attempt to measure coverage of social protection programmes, a global indicator, 'Proportion of the poorest households that received external economic support in the past three months', was proposed to measure the extent to which economic support is reaching households severely affected by various shocks.¹⁶⁸ Table EQ.2.CS2 presents the percentage of households in the lowest two quintiles that received social transfers or benefits during the outbreak of COVID-19 since March 2020, by type of transfers or benefits.

Finally, Table EQ.2.CS3 presents the percentage of children under age 18 living in households that received social transfers or benefits during the outbreak of COVID-19 since March 2020, by type of transfers or benefits, while Table EQ.2.8 presents the percentage of children and young people age 5-24 years in all households who

11.3 DISCRIMINATION AND HARASSMENT

Discrimination can impede individuals from accessing opportunities and services in a fair and equal manner. These questions are designed to measure the experiences of discrimination and harassment of respondents in the 12 months before the survey. The questions include specific grounds of discrimination and harassment which can increase the respondents' recall of events. The current questions are based on a recommended set of questions available at the start of MICS6. The questions may change given that methodological development is currently underway to move the indicator from a Tier III SDG indicator classification to Tier II. Tables EQ.3.1W and EQ.3.1M show the percentage of women and men who felt discriminated against based on a number of grounds.

Table EQ.3.1W: Discrimination and harassment (women)

Percentage of women age 15-49 years who in the past 12 months have felt discriminated against or harassed and those who have not felt discriminated against or harassed, Eswatini MICS, 2021-2022

	Percentage of women who in the last 12 months have felt discriminated against or harassed on the basis of:								Percentage of women who have not felt discriminated against or harassed in the last 12 months	Number of women
	Ethnic or immigration origin	Gender	Sexual orientation	Age	Religion or belief	Disability	Other reason	Any reason ¹

11.4 SUBJECTIVE WELL-BEING

Subjective perceptions of individuals of their incomes, health, living environments and the like, play a significant role in their lives and can impact their perception of well-being, irrespective of objective conditions such as actual income and physical health status¹⁶⁹.

Eswatini MICS, 2021-2022 included a question about happiness and the respondents' overall satisfaction with life. To assist respondents in answering the question on happiness, they were shown a card with smiling faces (and not so smiling faces) that corresponded to the response categories (see the Questionnaires in Appendix E) 'very happy', 'somewhat happy', 'neither happy nor unhappy', 'somewhat unhappy' and 'very unhappy'. They were then shown a pictorial of a ladder with steps numbered from 0 at the bottom to 10 at the top and asked to indicate at which step of the ladder they feel they are standing at the time of the survey to indicate their level of life satisfaction. Tables EQ.4.1W and EQ.4.1M present the percentage of women age 15-49 years, and age 15-24 years separately, who are very or somewhat satisfied with their life overall, ladder step reported and the average life satisfaction score.

In addition to the questions on life satisfaction and happiness, respondents were also asked two simple questions on whether they think their life improved during the last one year, and whether they think their life will be better in one year's time. Such information may contribute to the understanding of desperation that may exist among young people, as well as hopelessness and hopes for the future. Specific combinations of the perceptions during the last one year and expectations for the next one year may be valuable information to understand the general sense of well-being among young people. In Tables EQ.4.2W and EQ.4.2M, women's and men's perceptions of a better life are shown.

APPENDIX A SAMPLE DESIGN

The major features of the sample design are described in this appendix. Sample design features include defining the sampling frame, target sample size, sample allocation, listing in sample clusters, choice of domains, sampling stages, stratification, and the calculation of sample weights.

The primary objective of the sample design for the Eswatini MICS 2021-2022 was to produce statistically reliable estimates of most indicators, at the national level, for urban and rural areas, and for the four regions of the country: Hhohho, Manzini, Shiselweni and Lubombo. Urban and rural areas in each of the four regions were defined as the sampling strata. In designing the sample for the Eswatini MICS 2021-2022, it was useful to review the sample design and results of the MICS conducted in 2014, documented in the Final Report of that survey.

A multi-stage, stratified cluster sampling approach was used for the selection of the survey sample. The sampling frame was based on the 2017 Eswatini Census of Population and Housing. The primary sampling units (PSUs) selected at the first stage were the enumeration areas (EAs) defined for the census enumeration. A listing of households was conducted in each sample EA, and a sample of households was selected at the second stage. This is a type of probability sample, in which each household and household member has a positive and known probability of selection, once the listing of households in the sample PSUs is complete, and the list of household members in each interviewed sample household is complete. With probability sampling, it is possible to make valid inferences to the population or any subgroup of the population, through weighting the data by the inverse of the overall probabilities of selection.

A.1 SAMPLE SIZE AND SAMPLE ALLOCATION

Since the overall sample size for the Eswatini MICS 2021-2022 partly depends on the geographic domains of analysis that are defined for the survey tables, the distribution of EAs and households in Eswatini from the 2017 Census sampling frame was first examined by region, urban and rural strata, shown in Table SD.1.

Table SD.1: Distribution of Enumeration Areas and households in sampling frame

Distribution of EAs and households, by region, urban and rural strata, Census 2017						
	Number of EAs			Number of Households (2017 Census)		
	Total	Urban	Rural	Total	Urban	Rural
Total	2,260	602	1,658	264,856	93,144	171,712
Region						
Hhohho	641	198	443	74,127	23,800	50,327
Manzini	698	291	407	97,135	52,461	44,674
Shiselweni	445	29	416	43,736	5,523	38,213
Lubombo	476	84	392	49,858	11,360	38,498

The overall sample size for the Eswatini MICS was calculated as 5,265 households. For the calculation of the sample size, the key indicator used was the diarrhoea in last 2 weeks prevalence among children age 0-4 years. Since the survey results are tabulated at the regional level, it was necessary to determine the minimum sample size for each region. The following formula was used to estimate the required sample size for this indicator:

$$n = \frac{[4(r)(1 - r)(deff)]}{[(RME \times r)^2(pb)(AveSize)(RR)]}$$

where:

- n = the required sample size, expressed as number of households
- 4 = a factor to achieve the 95 percent level of confidence
- r = the predicted or anticipated value of the indicator, expressed in the form of a proportion
- $deff$ = the design effect for the indicator, estimated from a previous survey or using a default value of 1.5
- RME = the relative margin of error of r to be tolerated at the 95 percent level of confidence; it is generally not more than 0.12 (12 percent) for national-level estimates
- pb = the proportion of the total population upon which the indicator, r , is based
- $AveSize$ = the average household size (mean number of persons per household)
- RR = the predicted response rate

For the calculation, r (diarrhoea in last 2 weeks prevalence) was assumed to be 16.4 percent based on the national estimate from the MICS 2014. The value of $deff$ (design effect) was taken as 1.8 based on the estimate from the MICS 2014, pb (percentage of children age 0-4 years in the total population) was taken as 13 percent, $AveSize$ (mean household size) was taken as 4.0 households, and the response rate was assumed to be 93 percent, based on experience from the MICS 2014.

The number of households selected per cluster for the Eswatini MICS 2021-2022 MICS was determined as 15 households, based on several considerations, including the design effect, the budget available, and the time that would be needed per team to complete one cluster.

Proportional allocation of the total sample size to the four regions was used. In each region, the clusters (primary sampling units) were distributed to the urban and rural strata proportionally to the number of households in the census frame for each stratum within that region. Table SD.2 shows the allocation of the clusters and households to the sampling strata.

Table SD.2: Sample allocation						
Allocation of sample clusters (EAs) and sample households to sampling strata, Eswatini MICS, 2021-2022						
	Sample Clusters			Sample Households		
	Total	Urban	Rural	Total	Urban	Rural
Total	351	93	258	5,265	1,395	3,870
Region						
Hhohho	99	31	68	1,485	465	1,020
Manzini	106	44	62	1,590	660	930
Shiselweni	69	4	65	1,035	60	975
Lubombo	77	14	63	1,155	210	945

A.2 SELECTION OF ENUMERATION AREAS (CLUSTERS)

Census enumeration areas were selected from each of the sampling strata by using systematic probability proportional to size (pps) sampling procedures, based on the number of households in each enumeration area from the 2017 Census frame. The first stage of sampling was thus completed by selecting the required number of sample EAs (specified in Table SD.2) from each of the four regions, separately for the urban and rural strata.

A.3 LISTING ACTIVITIES

Given that there had been many changes in the households enumerated in the 2017 Census, a new listing of households was conducted in all the sample enumeration areas prior to the selection of households. For this purpose, listing teams were trained to visit all the selected enumeration areas and list all households in each enumeration area.

The listing training was conducted for a period of 5 days in Mbabane and began from 12th - 16th August 2019, whilst listing field work began on 19th August to mid-March 2020. Listing of all structures in selected EAs was conducted using tablets. This was after the initial analogue form was converted into a digital format using CSpro version 7.1.

For each selected EA, a 2015 orthophoto map showing the demarcation of its boundary was provided. All listed structures were identified on the given map and then indicated (plotted) on the provided orthophoto map. Structure types such as churches, schools, etc. were listed in the listing form and then plotted (circled) on the orthophoto map and labelled. However, for all listed homesteads, in addition to listing and plotting, stickers were placed on the doors of each homestead, indicating the homestead number, the number of households in each homestead as well as the date on which the listing was conducted. A manual explaining the protocol for conducting the mapping and listing of all structures was compiled and used during the training.

The composition of teams that were involved in the listing exercise included 2 Field coordinators, 8 Supervisors, 4 Information Technologist specialist (ITs), 40 Listers and 8 vehicle drivers. There were segmentation procedures of enumeration areas when applicable.

A.4 SELECTION OF HOUSEHOLDS

Lists of households were prepared by the listing teams in the field for each enumeration area. The households were then sequentially numbered from 1 to M_{hi} (the total number of households in each enumeration area) at the CSO where the selection of 15 households in each enumeration area was carried out using random systematic selection procedures. The MICS6 spreadsheet template for systematic random selection of households was adapted for this purpose.¹⁷⁰

The survey also included a questionnaire for individual men that was to be administered in half of the sample of households. The MICS household selection template includes an option to specify the proportion of households to be selected for administering the individual questionnaire for men, and the spreadsheet automatically selected the corresponding subsample of households.¹⁷⁰ All men age 15 to 49 years in the selected households were eligible for interview.

The Eswatini MICS 2021-2022 also included water quality testing for a subsample of households within each sample cluster. A subsample of 4 of the 15 selected households was selected in each sample cluster using random systematic sampling for conducting water quality testing, for both water in the household and at the source. The MICS household selection template includes an option to specify the number of households to be selected for the water quality testing, and the spreadsheet automatically selected the corresponding subsample of households.¹⁷⁰

A standard quality control measure was implemented through blank testing (a test of uncontaminated water) to assess whether teams were correctly performing the water testing procedure. One blank test was assigned to each cluster, but for practical purposes relating to data capture, this was assigned to the first household number selected for water quality testing.

A.5 CALCULATION OF SAMPLE WEIGHTS

The Eswatini MICS 2021-2022 sample is not self-weighting. Essentially, by allocating a similar number of households to each of the regions, different sampling fractions were used in each region since the number of households in the Census frame varies by region. For this reason, sample weights were calculated and used in the subsequent analyses of the survey data.

The major component of the weight is the reciprocal of the sampling fraction employed in selecting the number of sample households in that particular sampling stratum (h) and PSU (i):

$$W_{hi} = \frac{1}{f_{hi}}$$

The term f_{hi} , the sampling probability for the i -th sample PSU in the h -th stratum, is the product of the probabilities of selection at every stage in each sampling stratum:

$$f_{hi} = p_{1hi} \times p_{2hi} \times p_{3hi}$$

where p_{shi} is the probability of selection of the sampling unit at stage s for the i -th sample PSU in the h -th sampling stratum. Based on the sample design, these probabilities were calculated as follows:

¹⁷⁰ Available here: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 31, 2018. <http://mics.unicef.org/tools#survey-design>.

$$p_{1hi} = \frac{n_h \times M_{hi}}{M_h}$$

n_h = number of sample PSUs selected in stratum h
 M_{hi} = number of households in the 2017 Census frame for the i -th sample PSU in stratum h
 M_h = total number of households in the 2017 Census frame for stratum h
 p_{2hi} = proportion of the PSU listed in the i -th sample PSU in stratum h (in the case of PSUs that were segmented); for non-segmented PSUs, $p_{2hi} = 1$
 $p_{3hi} = \frac{15}{M'_{hi}}$
 M'_{hi} = number of households listed in the i -th sample PSU in stratum h

Since the number of households in each enumeration area (PSU) from the 2017 Census frame used for the first stage selection and the updated number of households in the EA from the listing are generally different, individual overall probabilities of selection for households in each sample EA (cluster) were calculated.

A final component in the calculation of sample weights takes into account the level of non-response for the household and individual interviews by stratum, as well as the sample cluster completion rate for each stratum. The adjustment for the cluster and household non-response in each stratum is equal to:

$$\frac{n_h}{n'_h} \times \frac{1}{RR_h}$$

where RR_h is the response rate for the sample households in stratum h , defined as the proportion of the number of interviewed households in stratum h out of the number of selected households found to be occupied during the fieldwork in stratum h . The term n'_h is the number of sample clusters with complete enumeration in stratum h , so the first adjustment factor corresponds to the inverse of the sample cluster completion rate for stratum h . This additional adjustment factor is needed in the case where some sample clusters cannot be enumerated in some strata due to security or accessibility problems. In the case where all the sample clusters in each stratum are enumerated, this cluster adjustment factor is equal to 1 for all strata, so it does not affect the weight. This adjustment of the household weight based on the cluster completion rate is included in the corresponding formulas in the MICS template for calculating the weights.

Similarly, adjustment for non-response at the individual level (women, men, and under-5 children) for each stratum is equal to:

$$\frac{1}{RR_{qh}}$$

where RR_{qh} is the response rate for the individual questionnaires in stratum h , defined as the proportion of eligible individuals (women, men, and under-5 children) in the sample households in stratum h who were successfully interviewed.

After the completion of fieldwork, response rates were calculated for each sampling stratum. These were used to adjust the sample weights calculated for each cluster. Response rates in the Eswatini MICS are shown in Table SR.1.1 in this report.

The non-response adjustment factors for the individual women and under-5 questionnaires were applied to the adjusted household weights. Numbers of eligible women and under-5 children were obtained from the list of household members in the Household Questionnaire for households where interviews were completed.

The weights for the questionnaire for individual men were calculated in a similar way. In this case the number of eligible men in the list of household members in all the MICS sample households in the stratum was used as the numerator of the non-response adjustment factor, while the number of completed questionnaires for men in the stratum was obtained from the 50% subsample of households. Therefore, this adjustment factor includes an implicit subsampling weighting factor of 2 in addition to the adjustment for the non-response to the individual questionnaire for men.

In the case of the questionnaire for children age 5-17 years, in each sample household, one child was randomly selected from all the children in this age group recorded in the list of household members, in effect a tertiary sampling unit. The household weight for the children age 5-17 years is first adjusted based on the response rate for this questionnaire at the stratum level. Once this adjusted household weight is normalised as described below, it is multiplied by the number of children age 5-17 years recorded in the list of household members. Therefore, the weights for the individual children age 5-17 years will vary by sample household. This weighting of the data for the children age 5-17 years old is implemented in the tabulation programs for the corresponding tables.

For the water quality testing (both in household and at source) a subsample of 4 households was selected from the 15 MICS sample households in each sample cluster. Therefore, the basic (unadjusted) household weight would be multiplied by the inverse of this subsampling rate as follows:

$$W_{wqhi} = \frac{1}{f_{hi}} \times \frac{15}{4} = \frac{3.75}{f_{hi}}$$

where:

W_{wqhi} = basic weight for the subsample of households selected for the water quality testing in the i -th sample EA in stratum h

Since the response rate may be different for the water quality testing for home consumption and at the source, the basic weights for each were adjusted separately for non-response at the stratum level as follows:

$$W'_{wqhi} = W_{wqhi} \times \frac{n_h}{n'_h} \times \frac{m_{wqh}}{m'_{wqh}}$$

where:

W'_{wqhi} = adjusted weight for the subsample of households selected for the water quality testing in the i -th sample EA in stratum h (separately for water quality testing in the household and at the source)

m_{wqh} = number of valid (occupied) sample households selected for water quality testing in stratum h

m'_{wqh} = number of sample households with completed water quality testing in stratum h (separately for water quality testing in the household and at the source)

As in the case of the adjustment of the raw household weights, an adjustment factor equal to the inverse of the cluster completion rate (n_h/n'_h) for the stratum is necessary to account for any sample clusters that could not be enumerated within a stratum. As mentioned above, this factor is equal to 1 for any stratum for which all the sample clusters were enumerated.

The Eswatini MICS full (raw) weights for the households were calculated by multiplying the inverse of the probabilities of selection by the non-response adjustment factor for each stratum. These weights were then standardised (or normalised), one purpose of which is to make the weighted sum of the interviewed sample units equal to the total sample size at the national level. Normalisation is achieved by dividing the full sample weights (adjusted for nonresponse) by the average of these weights across all households at the national level. This is performed by multiplying the sample weights by a constant factor equal to the unweighted number of households at the national level divided by the weighted total number of households (using the full sample weights adjusted for non-response). A similar standardisation procedure was followed in obtaining standardised weights for the individual women, men, under-5 questionnaires and water quality testing. Adjusted (normalised) household weights varied between 0.1434 and 4.2460 in the 351 sample enumeration areas (clusters).

Sample weights were appended to all data sets and analyses were performed by weighting the data for households, women, men, under-5s, 5-17-year olds and water quality testing with these sample weights.

APPENDIX B LIST OF PERSONNEL INVOLVED IN THE SURVEY

MICS Survey Management Team

CSO

MLANGENI Thabisile Principal Secretary, MEPD
SHABALALA Thembinkosi Director of Statistics, CSO

UNICEF

PARSI Afshin Deputy Representative, UNICEF
DLAMINI Nelisiwe Monitoring and Evaluation Specialist, UNICEF
ISIDORO Nelson Monitoring and Evaluation Specialist, UNICEF
RAMANANJATO Ranto Statistics & Monitoring Specialist, UNICEF
QUINTANA Eva Statistics Specialist, UNICEF
KALINO Maggie MICS Consultant, UNICEF
MAMADOU Eli Djerma MICS Consultant, UNICEF
MARTEL Pierre MICS Consultant, UNICEF

MICS Survey Team

GININDZA Choice Survey Coordinator, CSO
FAKUDZE Robert Data Manager, CSO
SIMELANE Sabelo GIS Manager, CSO
MALANGWANE Ronald Programmer, CSO
DLAMINI Senani Field Coordinator, CSO
MNGOMETULU Lucky Field Coordinator, CSO

The sample of respondents selected in the Eswatini MICS 2021-2022 is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results based on the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly, but can be estimated statistically from the survey data.

The following sampling error measures are presented in this appendix for each of the selected indicators:

- *Standard error (se)*: Standard error is the square root of the variance of the estimate. For survey indicators that are means, proportions or ratios, the Taylor series linearization method is used for the estimation of standard errors. For more complex statistics, such as fertility and mortality rates, the Jackknife repeated replication method is used for standard error estimation.
- *Coefficient of variation (se/r)* is the ratio of the standard error to the value (r) of the indicator, and is a measure of the relative sampling error.
- *Design effect (deff)* is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling based on the same sample size. The *square root of the design effect (deft)* is used to show the efficiency of the sample design in relation to the precision. A *deft* value of 1.0 indicates that the sample design of the survey is as efficient as a simple random sample for a particular indicator, while a *deft* value above 1.0 indicates an increase in the standard error due to the use of a complex sample design. If a *deft* (or *deff*) value is less than 1.0 and the corresponding number of observations is relatively small, the values of the standard error and confidence limits should be used with caution. These situations might stem from the small number of observations and the distribution of the indicator values within and between the sample clusters in such estimation domains
- *Confidence limits* are calculated to show the interval which contains the true value of the indicator for the population, with a specified level of confidence. For MICS results 95% confidence intervals are used, which is the standard for this type of survey. The concept of the 95% confidence interval can be understood in this way: if many repeated samples of identical size and design were taken and the confidence interval computed for each sample, then 95% of these intervals would contain the true value of the indicator.

For the calculation of sampling errors from MICS data, programs developed in CPro Version 6.3 and SPSS Version 24 Complex Samples module have been used.

The results are shown in the tables that follow. Sampling errors are calculated for SDG indicators for which SEs can be calculated, and several other MICS indicators. Definitions, numerators and denominators of each of these indicators are provided in Chapter 3. Results are presented for the national level (Table SE.1), for urban and rural areas (Tables SE.2 and SE.3), and for all regions (Tables SE.4 to SE.7).

In addition to the sampling error measures described above, the tables also include weighted and unweighted counts of denominators for each indicator. Given the use of normalized weights, by comparing the weighted and unweighted counts it is possible to determine whether a particular domain has been under-sampled or over-sampled compared to the average sampling rate. If the weighted count is smaller than the unweighted count, this means that the domain had been over-sampled.

For the following indicators, however, the unweighted count represents the number of sample households, and the weighted counts reflect the weighted total population living in these households.

- Access to electricity
- Primary reliance on clean fuels and technologies for cooking, space heating and lighting
- Use of basic drinking water services
- Use of safely managed drinking water services
- Handwashing facility with water and soap
- Use of basic sanitation services
- Safe disposal in situ of excreta from on-site sanitation facilities
- Population covered by social transfers

44	86	1.0	60	.7	Total	8,317	100.0	8,793	100.0

^A As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those shown for individuals in Tables SR.5.1W/M, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights. Tables DQ.1.2W/M, DQ.1.3 and DQ.1.4 similarly use household sample weights and do not match distributions obtained through individual questionnaires.

Table DQ.1.2W: Age distribution of eligible and interviewed women

Household population of women age 10-54 years, interviewed women age 15-49 years, and percentage of eligible women who were interviewed, Eswatini MICS, 2022-23

	Household population of women age 10-54 years		Interviewed women age 15-49 years		Percentage of eligible women interviewed (Completion rate)

D.3 COMPLETENESS AND MEASUREMENTS

Table DQ.3.1: Completeness of salt iodisation testing							
Percent distribution of households by completion of test for salt iodisation, Eswatini MICS, 2021-2022							
	Salt was tested			Salt was not tested, by reason			Number of households
	1st test	2nd test		No salt in household	Other ^A	Total	
	Iodised	Iodised	Not iodised				
Total	70.2	16.4	3.6	8.7	0.8	100.0	2,503
Area							
Urban	67.9	21.0	3.1	7.0	0.9	100.0	955
Rural	71.6	13.5	4.0	9.8	0.7	100.0	1,548
Region							
Hhohho	78.3	9.2	2.7	8.9	0.4	100.0	740
Manzini	55.0	32.3	3.4	8.0	1.0	100.0	948
Shiselweni	74.2	5.6	10.0	8.5	1.7	100.0	353
Lubombo	85.1	3.4	0.7	10.0	0.3	100.0	463
Wealth index quintile							
Poorest	63.0	15.6	3.6	16.8	0.5	100.0	532
Second	71.5	15.8	3.3	8.2	0.9	100.0	501
Middle	69.8	18.5	4.1	6.9	0.3	100.0	491
Fourth	66.9	18.6	5.2	8.3	1.0	100.0	479
Richest	80.0	13.5	2.1	2.9	1.2	100.0	500

^A Includes those households in which the first test indicated no reaction (not iodised) where a second test was not performed

Table DQ.3.2: Completeness and quality of information of water quality testing

Percentage of households selected for and with complete water quality testing at household and source, and (unweighted) percentage of positive blank tests, Eswatini MICS, 2021-2022

	Percentage of households:			Percentage of households with complete water quality test for:		Number of households selected for Water Quality Testing Questionnaire	Blank tests (unweighted)		
	Selected for Water Quality Testing questionnaire	With completed Water Quality Testing questionnaire	Number of households	Household drinking water	Source of drinking water		Percentage positive	Number completed	Number of households selectedA
Total	26.4	26.2	4,675	99.0	95.0	1,235	1.0	294	305
Area									
Urban	26.5	26.3	1,785	98.9	97.9	472	1.2	80	81
Rural	26.4	26.1	2,890	99.1	93.3	762	.9	214	224

^A One blank test (a test of uncontaminated water) was performed in each cluster. For practical reasons, the blank test was assigned to first of the households selected for water quality testing.

Table DQ.3.3W: Completeness of information on dates of marriage/union and sexual intercourse (women)

Percentage of women age 15-49 years with missing or incomplete information on date of and age at first marriage/union and age at first intercourse and time since last intercourse, Eswatini MICS, 2021-2022

	Percent with missing/incomplete information ^A	Number of women
Ever married (age 15-49 years)		
Date of first marriage/union missing	4.9	1,838
Only month missing	3.7	1,838
Both month and year missing	0.9	1,838
Age at first marriage/union missing	0.0	0
Ever had sex (age 15-49 years)		
Age at first intercourse missing	0.3	1,708
Time since last intercourse missing	0.4	1,708
Ever had sex (age 15-24 years)		
Age at first intercourse missing	0.0	432
Time since last intercourse missing	0.2	432

^A Includes "Don't know" responses

Table DQ.3.3M: Completeness of information on dates of marriage/union and sexual intercourse (men)

Percentage of men age 15-49 years with missing or incomplete information on date of and age at first marriage/union and age at first intercourse and time since last intercourse, Eswatini MICS, 2021-2022		
	Percent with missing/ incomplete information ^A	Number of men
Ever married (age 15-49 years)		
Date of first marriage/union missing	6.6	499
Only month missing	4.3	499
Both month and year missing	2.3	499
Age at first marriage/union missing	0.0	499
Ever had sex (age 15-49 years)		
Age at first intercourse missing	0.0	1,294
Time since last intercourse missing	0.0	1,294
Ever had sex (age 15-24 years)		
Age at first intercourse missing	0.0	327
Time since last intercourse missing	0.0	327

^A Includes "Don't know" responses

Table DQ.3.4: Completeness of information for anthropometric indicators: Underweight

Percent distribution of children under 5 by completeness of information on date of birth and weight, Eswatini MICS, 2021-2022

	Valid weight and date of birth	Reason for exclusion from analysis				Total	Percent of children excluded from analysis	Number of children under 5
		Weight not measured	Incomplete date of birth	Weight not measured and incomplete date of birth	Flagged cases (outliers)

SOCIAL TRANSFERS COVID-19

ST

ST1A. Check HH8: Is the household selected for Questionnaire for Men?	YES1 NO2	2 ⇒ End
--	-------------------------	---------

ST1. I would like to ask you about various external economic assistance programmes provided to households during the outbreak of Covid-19. This refers to the assistance that has been offered to households during the Covid-19 outbreak period specifically to help cushion households from the economic impact. By external assistance I mean support that comes from the government or from non-governmental organizations such as religious, charitable, or community-based organizations. This support was introduced after the declaration of the national state of emergency in March 2020. This excludes support from family, other relatives, friends or neighbours.

HH30G. Record the rank number (HH30B), line number (HH30C), name (HH30D) and age (HH30E) of the selected woman.

RANK NUMBER__

LINE NUMBER.....__ __

HH30H. (When HH29A=1 or when there is a single woman age 15-49 in the household): Record the rank number as '1' and record the line number (HL1), the name (HL2) and age (HL6) of this woman from the LIST OF HOUSEHOLD MEMBERS.

NAME _____

AGE __ __

HH30I. This woman has been selected to be administered the Gender Violence module in the QUESTIONNAIRE FOR WOMEN AGE 15-49. Record '01' in WM8A on individual questionnaire for selected woman then continue with HH31.

HH31. Check HL6 and HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any girls age 15-17?

YES, AT LEAST ONE GIRL AGE 15-17 1
NO 2

2 ⇒ HH34

HH32. Check HL20 in the LIST OF HOUSEHOLD MEMBERS: Is consent required for interviewing at least one girl age 15-17?

YES, AT LEAST ONE GIRL AGE 15-17 WITH HL20≠90 1
NO, HL20=90 FOR ALL GIRLS AGE 15-17 2

2 ⇒ HH34

HH33. As part of the survey we are also interviewing women age 15-49. We ask each person we interview for permission. A female interviewer conducts these interviews.

For girls age 15-17 we must also get permission from an adult to interview them. As mentioned before, all the information we obtain will remain strictly confidential and anonymous.

May we interview (*name(s) of female member(s) age 15-17*) later?

- 'Yes' for all girls age 15-17 ⇒ Continue with HH34.
- 'No' for at least one girl age 15-17 and 'Yes' to at least one girl age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on individual questionnaires for those adult consent was not given. Then continue with HH34.
- 'No' for all girls age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on all individual questionnaires for whom adult consent was not given. Then continue with HH34.

HH34. Check HH8 in the HOUSEHOLD INFORMATION PANEL: Is the household selected for Questionnaire for Men?	YES, HH8=1 1 NO, HH8=2 2	2 ⇒ HH40
HH35. Check HL9 in the LIST OF HOUSEHOLD MEMBERS: Are there any men age 15-49?	YES, AT LEAST ONE MAN AGE 15-49 1 NO 2	2 ⇒ HH40
HH36. Issue a separate QUESTIONNAIRE FOR INDIVIDUAL MEN for each man age 15-49 years.		
HH37. Check HL6 and HL9 in the LIST OF HOUSEHOLD MEMBERS: Are there any boys age 15-17?	YES, AT LEAST ONE BOY AGE 15-17 1 NO 2	2 ⇒ HH40
HH38. Check HL20 in the LIST OF HOUSEHOLD MEMBERS: Is consent required for interviewing at least one boy age 15-17?	YES, AT LEAST ONE BOY AGE 15-17 WITH HL20≠90 1 NO, HL20=90 FOR ALL BOYS AGE 15-17 2	2 ⇒ HH40

HH39. As part of the survey we are also interviewing men age 15-49. We ask each person we interview for permission. A male interviewer conducts these interviews.

For boys age 15-17 we must also get permission from an adult to interview them. As mentioned before, all the information we obtain will remain strictly confidential and anonymous.

May we interview (*name(s) of male member(s) age 15-17*) later?

- 'Yes' for all boys age 15-17 ⇒ Continue with HH40.
- 'No' for at least one boy age 15-17 and 'Yes' to at least one boy age 15-17 ⇒ Record '06' in MWM17 (also in UF17 and FS17, if applicable) on individual questionnaires for those adult consent was not given. Then continue with HH40.
- 'No' for all boys age 15-17 ⇒ Record '06' in MWM17 (also in UF17 and FS17, if applicable) on all individual questionnaires for whom adult consent was not given. Then continue with HH40.

HH40. Check HL10 in the LIST OF HOUSEHOLD MEMBERS: Are there any children age 0-4?	YES, AT LEAST ONE..... 1 NO 2	2 ⇒ HH42
HH41. Issue a separate QUESTIONNAIRE FOR CHILDREN UNDER FIVE for each child age 0-4 years.		
HH42. Check HH9 in the HOUSEHOLD INFORMATION PANEL: Is the household selected for Water Quality Testing Questionnaire?	YES, HH9=1 1 NO, HH9=2 2	2 ⇒ HH44A
HH43. Issue a separate WATER QUALITY TESTING QUESTIONNAIRE for this household		
HH44. As part of the survey we are also looking at the quality of drinking water. We would like to do a simple test of your drinking water. A colleague will come and collect the water samples. May we do such a test? <i>If the respondent requests to learn the results, explain that results will not be shared with individual households but will be made available at regional level.</i>	YES, PERMISSION IS GIVEN 1 NO, PERMISSION IS NOT GIVEN 2	2 ⇒ Record '02' in WQ31 on the WATER QUALITY TESTING QUESTIONNAIRE and then continue with HH44A
HH44A. Check HC7[A] and HC12: Does this household have a fixed telephone line or does any member of the household own a mobile phone?	YES, HC7[A]=1 OR HC12=1 1 NO, HC7[A]=2 AND HC12=2 2	2 ⇒ HH45
HH44B. Thank you for your participation. The Central Statistical Office will be conducting a phone survey about the situation of children, families and households in the future. We would like to invite you to participate in this survey. If you agree to participate, we will ask you to share a phone number we can reach you at and convenient times to contact you. The phone interview will take about 30 minutes, and we may call you a few times over a period of a few months. Participation in this phone survey is voluntary, and even if you agree to participate now, you may decide to withdraw from participation in the future. There will be no costs to you for participating in the phone survey. Please know that all the information you share during future phone interviews will remain strictly confidential, and your phone number will not be shared with anyone outside our team. Would you like to participate?		
YES..... 1 NO..... 2		2 ⇒ HH45
HH44C. Do you have a personal phone number or does your household have a communal number where you can be reached?	YES..... 1 NO 2	2 ⇒ HH45
HH44D. You may share your household communal number, but please, do not share any personal phone numbers that belong to individual members of your household. Please, tell me what is the best phone number to contact you on.		

	[P1] BEST NUMBER	[P2] 2 ND NUMBER	[P3] 3 RD NUMBER
HH44E. Ask for and record phone number.	_____	_____	_____

HH44F. Just to confirm, the number is (<i>number from HH44E</i>)? <i>If no, return to HH44E and correct entry.</i>	YES 1 NO2☒ <i>HH44E</i>	YES..... 1 NO 2☒ <i>HH44E</i>	YES 1 NO2☒ <i>HH44E</i>
HH44G. Is this a fixed line or a mobile phone number?	FIXED LINE 1 MOBILE2	FIXED LINE 1 MOBILE..... 2	FIXED LINE 1 MOBILE 2
HH44H. What is the best day of the week and time of the day to call you on this number? <i>Probe: Any other day or time?</i> <i>Record all mentioned.</i>	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify) X	WEEKDAYS MORNING..... A AFTERNOONB EVENINGC OTHER (specify) D WEEKEND MORNING.....E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify)..... X	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOONF EVENING G OTHER (specify) H OTHER (specify) X
HH44I. Remember, you may share your household communal number, but please, do not share any personal phone numbers that belong to individual members of your household. Do you have another personal or communal phone number where you can be reached?	YES1☒ <i>[P2]</i> NO2☒ <i>HH45</i>	YES..... 1☒ <i>[P3]</i> NO 2☒ <i>HH45</i>	YES 1☒ <i>[P4]</i> NO2☒ <i>HH45</i>
			Tick here if additional questionnaire used: <input type="checkbox"/>

HH45. Now return to the *HOUSEHOLD INFORMATION PANEL* and,

- Record '01' in question HH46 (*Result of the Household Questionnaire interview*),
- Record the name and the line number (from the *LIST OF HOUSEHOLD MEMBERS*) of the Respondent to the Household Questionnaire interview in HH47,
- Fill the questions HH48 – HH52,
- Thank the respondent for his/her cooperation and then
- Proceed with the administration of the remaining individual questionnaire(s) in this household.

If there is no individual questionnaire and no WATER QUALITY TESTING QUESTIONNAIRE to be completed in this household thank the respondent for his/her cooperation and move to the next household you have been assigned by your supervisor.

<p>MT15. Which social network did you use in the last 3 months?</p> <p><i>Circle all mentioned</i></p>	<p>WHATSAPP..... A FACEBOOK..... B TWITTER..... C INSTAGRAM..... D OTHER (<i>specify</i>) _____ X</p>	

FERTILITY/BIRTH HISTORY		CM
<p>CM1. Now I would like to ask about all the births you have had during your life. Have you ever given birth?</p> <p><i>This module and the birth history should only include children born alive. Any stillbirths should not be included in response to any question.</i></p>	YES..... 1 NO..... 2	2 ⇒ CM8
<p>CM2. Do you have any sons or daughters to whom you have given birth who are now living with you?</p>	YES..... 1 NO..... 2	2 ⇒ CM5
<p>CM3. How many sons live with you?</p> <p><i>If none, record '00'.</i></p>	SONS AT HOME _ _	
<p>CM4. How many daughters live with you?</p> <p><i>If none, record '00'.</i></p>	DAUGHTERS AT HOME _ _	
<p>CM5. Do you have any sons or daughters to whom you have given birth who are alive but do not live with you?</p>	YES..... 1 NO..... 2	2 ⇒ CM8
<p>CM6. How many sons are alive but do not live with you?</p> <p><i>If none, record '00'.</i></p>	SONS ELSEWHERE _ _	
<p>CM7. How many daughters are alive but do not live with you?</p> <p><i>If none, record '00'.</i></p>	DAUGHTERS ELSEWHERE _ _	
<p>CM8. Have you ever given birth to a boy or girl who was born alive but later died?</p> <p><i>If 'No' probe by asking: I mean, to any baby who cried, who made any movement, sound, or effort to breathe, or who showed any other signs of life even if for a very short time?</i></p>	YES..... 1 NO..... 2	2 ⇒ CM11
<p>CM9. How many boys have died?</p> <p><i>If none, record '00'.</i></p>	BOYS DEAD..... _ _	
<p>CM10. How many girls have died?</p> <p><i>If none, record '00'.</i></p>	GIRLS DEAD..... _ _	
<p>CM11. Sum answers to CM3, CM4, CM6, CM7, CM9 and CM10.</p>	SUM..... _ _	
<p>CM12. Just to make sure that I have this right, you have had in total (<i>total number in CM11</i>) births during your life. Is this correct?</p>	YES..... 1 NO..... 2	1 ⇒ CM14

CM13. Check responses to CM1-CM10 and make corrections as necessary until response in CM12 is 'Yes'.		
CM14. Check CM11: How many live births?	NO LIVE BIRTHS, CM11=00.....0 ONE OR MORE LIVE BIRTH, CM11=01 OR MORE1	0 ⇒ CM19

FERTILITY/BIRTH HISTORY

BH

BH0. Now I would like to record the names of all of your births, whether still alive or not, starting with the first one you had.

Record names of all of the births in BH1. Record twins and triplets on separate lines.

BH0. BH Line Number	BH1. What name was given to your (first/next) baby?	BH2. Were any of these births twins?	BH3. Is (<i>name of birth</i>) a boy or a girl?	BH4. In what day, month and year was (<i>name of birth</i>) born? <i>Probe: What is (his/her) birthday?</i>			BH5. Is (<i>name of birth</i>) still alive?	BH6. How old was (<i>name of birth</i>) at (his/her) last birthday? <i>Record age in completed years.</i>	BH7. Is (<i>name of birth</i>) living with you?	BH8. <i>Record household line number of child (from HL1)</i> <i>Record '00' if child is not listed.</i>	BH9. How old was (<i>name of birth</i>) when (he/she) died? <i>If '1 year', probe: How many months old was (name of birth)?</i> <i>Record days if less than 1 month; record months if less than 2 years; or years</i>			BH10. Were there any other live births between (<i>name of previous birth</i>) and (<i>name of birth</i>), including any children who died after birth?	
				Day	Month	Year					Y	N	Age	Y	N

POST-NATAL HEALTH CHECKS		PN
<p>PN1. Check CM17: Was there a live birth in the last 2 years?</p> <p>Copy name of last birth listed in the birth history (CM18) to here and use where indicated:</p> <p>Name _____</p>	<p>YES, CM17=1..... 1</p> <p>NO, CM17=0 OR BLANK..... 2</p>	2 ⇒ End
<p>PN2. Check MN20: Was the child delivered in a health facility?</p>	<p>YES, MN20=21-56 OR 76..... 1</p> <p>NO, MN20=11-12, 81 OR 96 2</p>	2 ⇒ PN7
<p>PN3. Now I would like to ask you some questions about what happened in the hours and days after the birth of (<i>name</i>).</p> <p>You have said that you gave birth in (<i>name or type of facility in MN20</i>). How long did you stay there after the delivery?</p> <p>If less than one day, record hours. If less than one week, record days. Otherwise, record weeks.</p>	<p>HOURS 1 ___</p> <p>DAYS..... 2 ___</p> <p>WEEKS..... 3 ___</p> <p>DK / DON'T REMEMBER..... 998</p>	
<p>PN4. I would like to talk to you about checks on (<i>name</i>)'s health after delivery – for example, someone examining (<i>name</i>), checking the cord, or seeing if (<i>name</i>) is ok.</p> <p>Before you left the (<i>name or type of facility in MN20</i>), did anyone check on (<i>name</i>)'s health?</p>	<p>YES 1</p> <p>NO..... 2</p>	
<p>PN5. And what about checks on <u>your</u> health – I mean, someone asking questions or examining you?</p> <p>[A] Did anyone ask questions about your health before you left (<i>name or type or facility in MN20</i>)?</p> <p>[B] Did anyone examine you before you left (<i>name or type or facility in MN20</i>)?</p>	<p>YES NO</p> <p>ASKED QUESTIONS 1 2</p> <p>EXAMINED YOU..... 1 2</p>	
<p>PN6. Now I would like to talk to you about what happened after you left (<i>name or type of facility in MN20</i>).</p> <p>Did anyone check on (<i>name</i>)'s health after you left (<i>name or type of facility in MN20</i>)?</p>	<p>YES 1</p> <p>NO..... 2</p>	1 ⇒ PN12 2 ⇒ PN17
<p>PN7. Check MN19: Did a health professional, traditional birth attendant, or rural health motivator assist with the delivery?</p>	<p>YES, AT LEAST ONE OF THE CATEGORIES A TO G RECORDED..... 1</p> <p>NO, NONE OF THE CATEGORIES A TO G RECORDED 2</p>	2 ⇒ PN11

<p>PN8. You have already said that (<i>person or persons in MN19</i>) assisted with the birth. Now I would like to talk to you about checks on (<i>name</i>)’s health after delivery, for example examining (<i>name</i>), checking the cord, or seeing if (<i>name</i>) is ok.</p> <p>After the delivery was over and before (<i>person or persons in MN19</i>) left you, did (<i>person or persons in MN19</i>) check on (<i>name</i>)’s health?</p>	<p>YES 1</p> <p>NO..... 2</p>	
<p>PN9. And did (<i>person or persons in MN19</i>) check on <u>your</u> health before leaving, for example asking questions about your health or examining you?</p>	<p>YES 1</p> <p>NO..... 2</p>	
<p>PN10. After the (<i>person or persons in MN19</i>) left you, did anyone check on the health of (<i>name</i>)?</p>	<p>YES 1</p> <p>NO..... 2</p>	<p>1 ⇒PN12</p> <p>2 ⇒PN19</p>
<p>PN11. I would like to talk to you about checks on (<i>name</i>)’s health after delivery – for example, someone examining (<i>name</i>), checking the cord, or seeing if the baby is ok.</p> <p>After (<i>name</i>) was delivered, did anyone check on (his/her) health?</p>	<p>YES 1</p> <p>NO..... 2</p>	<p>2 ⇒PN20</p>
<p>PN12. Did such a check happen only once, or more than once?</p>	<p>ONCE..... 1</p> <p>MORE THAN ONCE 2</p>	<p>1 ⇒PN13 A</p> <p>2 ⇒PN13 B</p>
<p>PN13A. How long after delivery did that check happen?</p> <p>PN13B. How long after delivery did the first of these checks happen?</p> <p><i>If less than one day, record hours.</i> <i>If less than one week, record days.</i> <i>Otherwise, record weeks.</i></p>	<p>HOURS 1 ___</p> <p>DAYS..... 2 ___</p> <p>WEEKS..... 3 ___</p> <p>DK / DON’T REMEMBER..... 998</p>	
<p>PN14. Who checked on (<i>name</i>)’s health at that time?</p>	<p>HEALTH PROFESSIONAL</p> <p>DOCTOR..... LIFE SATISFACTION		LS
LS0. Check HH8 in the <i>HOUSEHOLD QUESTIONNAIRE</i> : Is the household selected for <i>Questionnaire for Men</i> ?	YES1 NO.....2	1 ⇒End
LS1. I would like to ask you some simple questions on happiness and satisfaction. First, taking all things together, would you say you are very happy, somewhat happy, neither happy nor unhappy, somewhat unhappy or very unhappy? I am now going to show you pictures to help you with your response. <i>Show smiley card and explain what each symbol represents. Record the response code selected by the respondent.</i>	VERY HAPPY1 SOMEWHAT HAPPY2 NEITHER HAPPY NOR UNHAPPY3 SOMEWHAT UNHAPPY.....4 VERY UNHAPPY5	
LS2. Show the picture of the ladder. Now, look at this ladder with steps numbered from 0 at the bottom to 10 at the top. Suppose we say that the top of the ladder represents the best possible life for you and the bottom of the ladder represents the worst possible life for you. On which step of the ladder do you feel you stand at this time? <i>Probe if necessary:</i> Which step comes closest to the way you feel?	LADDER STEP__ __	
LS3. Compared to this time last year, would you say that your life has improved, stayed more or less the same, or worsened, overall?	IMPROVED.....1 MORE OR LESS THE SAME2 WORSENERD3	
LS4. And in one year from now, do you expect that your life will be better, will be more or less the same, or will be worse, overall?	BETTER1 MORE OR LESS THE SAME2 WORSE3	

GENDER VIOLENCE		GV
GV0A. Check HH8 in the HOUSEHOLD QUESTIONNAIRE: Is the household selected for Questionnaire for Men?	YES..... 1 NO..... 2	1 ⇒ End
GV0. Check line number in WM8A, is woman selected for Gender Violence module?	WOMEN SELECTED FOR GV MODULE ... 1 WOMEN NOT SELECTED 2	2 ⇒ End
GV1. Check for presence of others: Do not continue until privacy is ensured.	PRIVACY OBTAINED 1 PRIVACY NOT POSSIBLE 2	2 ⇒ GV17
<p>GV1A. Read to the respondent:</p> <p>Now I would like to ask you questions about some other important aspects of a woman's life. You may find some of these questions very personal. However, your answers are CRUCIAL FOR helping to understand the condition of women in Eswatini. Let me assure you again that your answers are completely confidential and will not be told to anyone and no one else in your household will know that you were asked these questions. If I ask you any question you don't want to answer, just let me know and I will go on to the next question. If you wish to stop the interview at any point, just let me know. If someone interrupts the interview at any time, I will stop the interview immediately and will change subject. I will not resume the interview until they are gone. If they don't leave, I will ask you to find another private area to continue with the interview. If it is not possible to continue the interview in private, I will ask you that we reschedule the interview for another time when we can have greater privacy, if that is possible and convenient for you. May I start now?</p>

MMH1. Now I would like to talk to you about mental health. By this I mean emotional, psychological and social well-being which affects how we think, feel and act. Mental health is important as it helps how we handle stress, relate to other and make choices.

Let me assure you again that your answers are completely confidential and will not be told to anyone.

<p>MMH2. During the past 12 months, have you seriously considered attempting suicide?</p>	<p>YES 1 NO 2 REFUSED TO ANSWER/NO ANSWER 8</p>	
<p>MMH3. Have you ever attempted suicide?</p>	<p>YES 1 NO 2 REFUSED TO ANSWER/NO ANSWER 8</p>	
<p>MMH4. Has anyone in your close family (mother, father, brother, sister or children) ever attempted suicide?</p>	<p>YES 1 NO 2 REFUSED TO ANSWER/NO ANSWER 8</p>	<p>2 ⇒ End</p>
<p>MMH5. Has anyone in your close family (mother, father, brother, sister or children) ever died from suicide?</p>	<p>YES 1 NO 2 REFUSED TO ANSWER/NO ANSWER 8</p>	

LIFE SATISFACTION

MLS

MLS1. I would like to ask you some simple questions on happiness and satisfaction.

First, taking all things together, would you say you are very happy, somewhat happy, neither happy nor unhappy, somewhat unhappy or very unhappy?

I am now going to show you pictures to help you with your response.

Show smiley card and explain what each symbol represents. Record the response code selected by the respondent.

- VERY HAPPY 1
- SOMEWHAT HAPPY 2
- NEITHER HAPPY NOR UNHAPPY 3
- SOMEWHAT UNHAPPY 4
- VERY UNHAPPY 5

MLS2. *Show the picture of the ladder.*

Now, look at this ladder with steps numbered from 0 at the bottom to 10 at the top.

Suppose we say that the top of the ladder represents the best possible life for you and the bottom of the ladder represents the worst possible life for you.

On which step of the ladder do you feel you stand at this time?

Probe if necessary: Which step comes closest to the way you feel?

LADDER STEP ____ ____

MLS3. Compared to this time last year, would you say that your life has improved, stayed more or less the same, or worsened, overall?

- IMPROVED 1
- MORE OR LESS THE SAME 2
- WORSENERD 3

MLS4. And in one year from now, do you expect that your life will be better, will be more or less the same, or will be worse, overall?

- BETTER 1
- MORE OR LESS THE SAME 2
- WORSE 3

**Very
happy**

Somewhat happy

**Neither happy,
nor unhappy**

**Somewhat
unhappy**

**Very
unhappy**

Best Possible Life

Worst Possible Life

MWM10. Record the time.	HOURS AND MINUTES __ __ : __ __	
MWM11. Was the entire interview completed in private or was there anyone else during the entire interview or part of it?	YES, THE ENTIRE INTERVIEW WAS COMPLETED IN PRIVATE..... 1 NO, OTHERS WERE PRESENT DURING THE ENTIRE INTERVIEW (specify) _____ 2 NO, OTHERS WERE PRESENT DURING PART OF THE INTERVIEW (specify) _____ 3	
MWM12. Language of the Questionnaire.	ENGLISH 1 SISWATI..... 2	
MWM13. Language of the Interview.	ENGLISH 1 SISWATI..... 2	
MWM14. Native language of the Respondent.	ENGLISH 1 SISWATI..... 2 OTHER LANGUAGE (specify) _____ 6	
MWM15. Was a translator used for any parts of this questionnaire?	YES, THE ENTIRE QUESTIONNAIRE..... 1 YES, PARTS OF THE QUESTIONNAIRE 2 NO, NOT USED 3	

MWM15A. Check the name and line number of this questionnaire's respondent (MWM3). Check the names and line numbers of the respondents to all other questionnaires that have been completed in this household: HOUSEHOLD QUESTIONNAIRE (HH47), 5 TO 17 QUESTIONNAIRE (FS4) or UNDER 5 QUESTIONNAIRE (UF4): Has this questionnaire's respondent already been interviewed with any of the other questionnaires?	YES, ALREADY INTERVIEWED (MWM3=HH47 OR MWM3=FS4 OR MWM3=UF4) 1 NO, FIRST INTERVIEW (WM3≠HH47 AND MWM3≠FS4 AND MWM3≠UF4) 2	1 ⇒ MWM16
MWM15B. Check HC7[A] and HC12: Does this household have a fixed telephone line or does any member of the household own a mobile phone?	YES, HC7[A]=1 OR HC12=1 1 NO, HC7[A]=2 AND HC12=2..... 2	2 ⇒ MWM16

MWM15C. Thank you for your participation.

The Central Statistical Office will be conducting a phone survey about the situation of children, families and households in the future. We would like to invite you to participate in this survey. If you agree to participate, we will ask you to share a phone number we can reach you at and convenient times to contact you. The phone interview will take about 30 minutes, and we may call you a few times over a period of a few months. Participation in this phone survey is voluntary, and even if you agree to participate now, you may decide to withdraw from participation in the future. There will be no costs to you for participating in the phone survey. Please know that all the information you share during future phone interviews will remain strictly confidential, and your phone number will not be shared with anyone outside our team. Would you like to participate?

YES	1	2 ⇒ MWM16
NO.....	2	

MWM15D. Do you have a personal phone number or does your household have a communal number where you can be reached?	YES	1	2 ⇒ MWM16
	NO.....	2	

MWM15E. You may share your household communal number, but please, do not share any personal phone numbers that belong to individual members of your household. Please, tell me what is the best phone number to contact you on.

	[P1] BEST NUMBER	[P2] 2 ND NUMBER	[P3] 3 RD NUMBER
MWM15F. Ask for and record phone number.	_____	_____	_____
MWM15G. Just to confirm, the number is (<i>number from WM15F</i>)? <i>If no, return to WM15F and correct entry.</i>	YES 1 NO 2 ⇨ MWM15F	YES 1 NO 2 ⇨ MWM15F	YES 1 NO 2 ⇨ MWM15F
MWM15H. Is this a fixed line or a mobile phone number?	FIXED LINE 1 MOBILE 2	FIXED LINE 1 MOBILE 2	FIXED LINE 1 MOBILE 2
MWM15I. What is the best day of the week and time of the day to call you on this number? <i>Probe: Any other day or time?</i> <i>Record all mentioned.</i>	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify) X	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify) X	WEEKDAYS MORNING A AFTERNOON B EVENING C OTHER (specify) D WEEKEND MORNING E AFTERNOON F EVENING G OTHER (specify) H OTHER (specify) X
MWM15J. Remember, you may share your household communal number, but please, do not share any personal phone numbers that belong to individual members of your household. Do you have another personal or communal phone number where you can be reached?	YES 1 ⇨ [P2] NO 2 ⇨ MWM16	YES 1 ⇨ [P3] NO 2 ⇨ MWM16	YES 1 ⇨ [P4] NO 2 ⇨ MWM16

Tick here if additional questionnaire used:

MWM16. Check columns HL10 and HL20 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE:

Is the respondent the caretaker of any child age 0-4 living in this household?

Yes ⇒ Go to MWM17 in MAN'S INFORMATION PANEL and record '01'. Then go to the QUESTIONNAIRE FOR CHILDREN UNDER FIVE for that child and start the interview with this respondent.

No ⇒ Check HH26-HH27 in HOUSEHOLD QUESTIONNAIRE: Is there a child age 5-17 selected for QUESTIONNAIRE FOR CHILDREN AGE 5-17?

Yes ⇒ Check column HL20 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: Is the respondent the caretaker of the child selected for QUESTIONNAIRE FOR CHILDREN AGE 5-17 in this household?

Yes ⇒ Go to MWM17 in MAN'S INFORMATION PANEL and record '01'. Then go to the QUESTIONNAIRE FOR CHILDREN AGE 5-17 for that child and start the interview with this respondent.

No ⇒ Go to MWM17 in MAN'S INFORMATION PANEL and record '01'. Then end the interview with this respondent by thanking him for his cooperation. Check to see if there are other questionnaires to be administered in this household.

No ⇒ Go to MWM17 in MAN'S INFORMATION PANEL and record '01'. Then end the interview with this respondent by thanking him for his cooperation. Check to see if there are other questionnaires to be administered in this household.

UF16. Tell the respondent that you will need to measure the weight and height of the child before you leave the household and a colleague will come to lead the measurement. Issue the ANTHROPOMETRY MODULE FORM for this child and complete the Information Panel on that Form.

Check columns HL10 and HL20 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: Is the respondent the mother or caretaker of another child age 0-4 living in this household?

Yes ⇒ Go to UF17 on the UNDER-FIVE INFORMATION PANEL and record '01'. Then go to the next QUESTIONNAIRE FOR CHILDREN UNDER FIVE to be administered to the same respondent.

No ⇒ Check HL6 and column HL20 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: Is the respondent the mother or caretaker of a child age 5-17 selected for Questionnaire for Children Age 5-17 in this household?

Yes ⇒ Go to UF17 on the UNDER-FIVE INFORMATION PANEL and record '01'. Then go to the QUESTIONNAIRE FOR CHILDREN AGE 5-17 to be administered to the same respondent.

No ⇒ Go to UF17 on the UNDER-FIVE INFORMATION PANEL and record '01'. Then end the interview with this respondent by thanking her/him for her/his cooperation. Check to see if there are other questionnaires to be administered in this household.

CHILD LABOUR

CL

CL1. Now I would like to ask about any work (*name*) may do.

Since last (*day of the week*), did (*name*) do any of the following activities, even for only one hour?

YES NO

[A] Did (*name*) do any work or help on (his/her) own or the household's plot, farm, food garden? For example, growing farm produce, harvesting, feeding or milking animals, excluding herding?

WORKED ON PLOT, FARM, FOOD GARDEN 1 2

[B] Did (*name*) help in a family business or a relative's business with or without pay, or run (his/her) own business?

HELPED IN FAMILY / RELATIVE'S BUSINESS / RAN OWN BUSINESS ... 1 2

[C] Did (*name*) produce or sell articles, handicrafts, clothes, food or agricultural products?

PRODUCE / SELL ARTICLES / HANDICRAFTS / CLOTHES / FOOD OR AGRICULTURAL PRODUCTS..... 1 2

[X] Since last (*day of the week*), did (*name*) engage in any other activity in return for income in cash or in kind, even for only one hour?

ANY OTHER ACTIVITY 1 2

CL2. Check CL1, [A]-[X]:

AT LEAST ONE 'YES' 1
ALL ANSWERS ARE 'NO' 2 2 ⇒ CL7

CL3. Since last (*day of the week*) about how many hours did (*name*) engage in (this activity/these activities), in total?

NUMBER OF HOURS _ _

If less than one hour, record '00'.

CL4. (Does the activity/Do these activities) require carrying heavy loads?

YES 1
NO 2

CL5. (Does the activity/Do these activities) require working with dangerous tools such as knives and similar or operating heavy machinery?

YES 1
NO 2

<p>CL6. How would you describe the work environment of (<i>name</i>)?</p> <p>[A] Is (he/she) exposed to dust, fumes or gas?</p> <p>[B] Is (he/she) exposed to extreme cold, heat or humidity?</p> <p>[C] Is (he/she) exposed to loud noise or vibration?</p> <p>[D] Is (he/she) required to work at heights?</p> <p>[E] Is (he/she) required to work with chemicals, such as pesticides, glues and similar, or explosives?</p> <p>[F] Is (he/she) required to work in the rain?</p> <p>[X] Is (<i>name</i>) exposed to other things, processes or conditions bad for (his/her) health or safety?</p>	<p>YES 1 NO 2</p> <p>YES 1 NO 2</p> <p>YES 1 NO 2</p> <p>YES 1 NO 2</p> <p>YES 1 NO 2</p> <p>YES 1 NO 2</p> <p>YES 1 NO 2</p>	
<p>CL7. Since last (<i>day of the week</i>), did (<i>name</i>) fetch water for household use?</p>	<p>YES 1 NO 2</p>	<p>2 ⇒CL9</p>
<p>CL8. In total, how many hours did (<i>name</i>) spend on fetching water for household use, since last (<i>day of the week</i>)?</p> <p><i>If less than one hour, record '00'.</i></p>	<p>NUMBER OF HOURS __ __</p>	
<p>CL9. Since last (<i>day of the week</i>), did (<i>name</i>) collect firewood, dry aloe leaves or cow dung for household use?</p>	<p>YES 1 NO 2</p>	<p>2 ⇒CL10A</p>
<p>CL10. In total, how many hours did (<i>name</i>) spend on collecting firewood, dry aloe leaves or cow dung for household use, since last (<i>day of the week</i>)?</p> <p><i>If less than one hour, record '00'.</i></p>	<p>NUMBER OF HOURS __ __</p>	
<p>CL10A. Since last (<i>day of the week</i>), did (<i>name</i>) herd animals for this household or any other households?</p>	<p>YES 1 NO 2</p>	<p>2 ⇒CL11</p>
<p>CL10B. In total, how many hours did (<i>name</i>) spend herding animals for this household or the other households since last (<i>day of the week</i>)?</p> <p><i>If less than one hour, record '00'.</i></p>	<p>NUMBER OF HOURS __ __</p>	

CL11. Since last (<i>day of the week</i>), did (<i>name</i>) do any of the following for this household?	YES	NO
[A] Shopping for the household?	SHOPPING FOR HOUSEHOLD 1	2
[B] Cooking?	COOKING..... 1	2
[C] Washing dishes or cleaning around the house?	WASHING DISHES / CLEANING HOUSE..... 1	2
[D] Washing clothes?	WASHING CLOTHES 1	2
[E] Caring for children?	CARING FOR CHILDREN 1	2
[F] Caring for someone old or sick?	CARING FOR OLD / SICK 1	2
[G] Going to the maize mill?	GOING TO MAIZE MILL 1	2
[X] Other household tasks?	OTHER HOUSEHOLD TASKS 1	2
CL12. Check CL11, [A]-[X]:	AT LEAST ONE 'YES' 1 ALL ANSWERS ARE 'NO' 2	2 ⇒ End
CL13. Since last (<i>day of the week</i>), about how many hours did (<i>name</i>) engage in (this activity/these activities), in total? <i>If less than one hour, record '00'</i>	NUMBER OF HOURS __ __	

CHILD DISCIPLINE		FCD
FCD1. Check CB3: Child's age?	AGE 5-14 YEARS..... 1 AGE 15-17 YEARS..... 2	2 ⇒ End
<p>FCD2. Now I'd like to talk to you about something else.</p> <p>Adults use certain ways to teach children the right behaviour or to address a behaviour problem. I will read various methods that are used. Please tell me if you or any other adult in your household has used this method with (<i>name</i>) in the past month.</p> <p>[A] Took away privileges, forbade something (<i>name</i>) liked or did not allow (him/her) to leave the house.</p> <p>[B] Explained why (<i>name</i>)'s behaviour was wrong.</p> <p>[C] Shook (him/her).</p> <p>[D] Shouted, yelled at or screamed at (him/her).</p> <p>[E] Gave (him/her) something else to do.</p> <p>[F] Spanked, hit or slapped (him/her) on the bottom with bare hand.</p> <p>[G] Hit (him/her) on the bottom or elsewhere on the body with something like a belt, hairbrush, stick or other hard object.</p> <p>[H] Called (him/her) dumb, lazy or another name like that.</p> <p>[I] Hit or slapped (him/her) on the face, head or ears.</p> <p>[J] Hit or slapped (him/her) on the hand, arm, or leg.</p> <p>[K] Beat (him/her) up, that is hit him/her over and over as hard as one could.</p>	<p>YES NO</p> <p>TOOK AWAY PRIVILEGES 1 2</p> <p>EXPLAINED WRONG BEHAVIOR 1 2</p> <p>SHOOK HIM/HER 1 2</p> <p>SHOUTED, YELLED, SCREAMED 1 2</p> <p>GAVE SOMETHING ELSE TO DO 1 2</p> <p>SPANKED, HIT, SLAPPED ON BOTTOM WITH BARE HAND 1 2</p> <p>HIT WITH BELT, HAIRBRUSH, STICK OR OTHER HARD OBJECT 1 2</p> <p>CALLED DUMB, LAZY OR ANOTHER NAME 1 2</p> <p>HIT / SLAPPED ON THE FACE, HEAD OR EARS 1 2</p> <p>HIT / SLAPPED ON HAND, ARM OR LEG 1 2</p> <p>BEAT UP, HIT OVER AND OVER AS HARD AS ONE COULD 1 2</p>	
FCD3. Check FS4: Is this respondent the mother or caretaker of any other children under age 5?	YES..... 1 NO..... 2	2 ⇒ FCD5
FCD4. Check FS4: Has this respondent already responded to the following question (UCD5) for another child?	YES..... 1 NO..... 2	1 ⇒ End

FCD5. Do you believe that in order to bring up, raise, or educate a child properly, the child needs to be physically punished?	YES..... 1	
	NO 2	
	DK / NO OPINION 8	

CHILD FUNCTIONING		FCF
<p>FCF1. I would like to ask you some questions about difficulties (<i>name</i>) may have.</p> <p>Does (<i>name</i>) wear glasses or contact lenses?</p>	<p>YES.....1 NO2</p>	
<p>FCF2. Does (<i>name</i>) use a hearing aid?</p>	<p>YES.....1 NO2</p>

FOUNDATIONAL LEARNING SKILLS

FL

FL0. Check CB3: Child's age?	AGE 5-6 YEARS	1	1 ⇨ End
	AGE 7-14 YEARS	2	
	AGE 15-17 YEARS	3	

FL1. Now I would like to talk to (*name*). I will ask (him/her) a few questions about (himself/herself) and about reading, and then ask (him/her) to complete a few reading and number activities.

These are not school tests and the results will not be shared with anyone, including other parents or the school.

You will not benefit directly from participating and I am not trained to tell you how well (*name*) has performed.

The activities are to help us find out how well children in this country are learning to read and to use numbers so that improvements can be made.

This will take about 20 minutes. Again, all the information we obtain will remain strictly confidential and anonymous.

May I talk to (<i>name</i>)?	YES, PERMISSION IS GIVEN	1	2 ⇨ FL28
	NO, PERMISSION IS NOT GIVEN	2	

FL2. Record the time.	HOURS AND MINUTES	__ : __
------------------------------	-------------------------	---------

FL3. My name is (*your name*). I would like to tell you a bit about myself.

Could you tell me a little bit about yourself?

When the child is comfortable, continue with the verbal consent:

Let me tell you why I am here today. I am from Central Statistical Office. I am part of a team trying to find out how children are learning to read and to use numbers. We are also talking to some of the children about this and asking them to do some reading and number activities. (Your mother/*Name of caretaker*) has said that you can decide if you want to help us. If you wish to help us, I will ask you some questions and give you some activities to do. I will explain each activity, and you can ask me questions any time. You do not have to do anything that you do not want to do. After we begin, if you do not want to answer a question or you do not want to continue that is alright.

Are you ready to get started?	YES	1	2 ⇨ FL28
	NO / NOT ASKED	2	

FL4. Before you start with the reading and number activities, tick each box to show that:

- You are not alone with the child unless they are at least visible to an adult known to the child.
- You have engaged the child in conversation and built rapport, e.g. using an Icebreaker.
- The child is sat comfortably, able to use the **READING & NUMBERS BOOK** without difficulty while you can see which page is open.

FL6. First, we are going to talk about reading.	YES	NO
	[A] Do you read books at home?	READS BOOKS AT HOME.....1
[B] Does someone read to you at home?	READ TO AT HOME.....1	2
